

Descriptive analysis of the results of the monitoring programme for Campylobacter in broiler flocks and broiler carcasses in the UK

Maes o ddiddordeb ymchwil: [Foodborne pathogens](#)

Hyd yr astudiaeth: 2016-01-01

Cod prosiect: FS101126

Cynhaliwyd gan: Animal and Plant Health Agency

Background

The monitoring programme aims to identify differences in prevalence and/or levels of Campylobacter contamination and production practices within the UK broiler population which could potentially be used to target further and more intensive investigations aimed at identifying 'protective' factors in controlling Campylobacter in the slaughterhouse.

This report describes the epidemiology of the broiler slaughter batches collected from January 2016 through to March 2017 (inclusive) under project FS101126.

A total of 622 carcasses were sampled and enumerated for Campylobacter. Nineteen abattoirs, associated with eleven parent companies, participated in the survey.
