Listeria

What you can do to reduce the chances of your food being infected with listeria.

Listeria monocytogenes (listeria) is a bacterium that causes an illness called listeriosis. Cases of foodborne illness from listeria are rare, but can involve serious symptoms and even death in certain groups of people. These include:

- people with weakened immune systems, such as those suffering from cancer
- pregnant women and their unborn babies
- newborn babies
- elderly people

The types of food listeria can be found in

Listeria is widespread in the environment and can contaminate a wide range of foods. It is of most concern in chilled ready-to-eat foods that do not require further cooking or reheating, such as:

- cooked sliced meats
- cured meats
- smoked fish
- cooked shellfish
- blue veined and mould-ripened soft cheeses
- pate
- pre-prepared sandwiches and salads

What you can do to avoid listeria

To reduce the risk of listeria when preparing food at home, it’s important to:

- keep raw and ready-to-eat foods separate to avoid cross-contamination
- wash fruit and vegetables thoroughly
- keep chilled ready-to-eat foods cold – make sure your fridge is working properly and is set to 5?C or below
- always use foods by their use-by date
- follow the storage instructions on the label and use opened foods within two days unless instructions on the packaging say otherwise
- ready-to-eat food must be eaten within four hours of being taken out of the fridge
- cook or reheat foods until they are piping hot right through
- ensure that you follow manufacturer’s instructions in the preparation of all foods
Advice for healthcare and social care organisations

We have developed guidance for healthcare and social care organisations to help protect people within their care from contracting listeriosis.
