

## The FSA Risk Communication Toolkit

Area of research interest: Behaviour and perception

Project status: Completed

Risk communication refers to the exchange of real-time information, advice and opinions between experts and people facing threats to their health, economic or social well-being.

## **Objectives**

The toolkit provides a framework for communicating food risk to consumers. It has been developed to:

- Make risk communications planning rigorous and consistent with the latest thinking
- Support science, policy and strategy teams in understanding how to communicate effectively

## Research approach

The content of the toolkit is drawn from advice from the <u>FSA Science Council</u> and a working group of the <u>FSA Advisory Committee for Social Science</u>, and supported by bespoke research including:

- A <u>review of the available literature</u> exploring risk communication theory and the way that 18 other Government organisations have set out their communications toolkits
- Qualitative research with communications practitioners and intermediaries as well as consumers across England, Wales and Northern Ireland

The toolkit comes with a checklist to use when developing risk communications.

The core principles outlined in this toolkit are complementary with the <u>Government</u> <u>Communications Services' OASIS model</u> which was developed to bring order and clarity to planning campaigns.
