This report has been produced by Premier Analytical Services under a contract placed by the Food Standards Agency (the Agency). The views expressed herein are not necessarily those of the Agency. Premier Analytical Services warrants that all reasonable skill and care has been used in preparing this report. Notwithstanding this warranty, Premier Analytical Services shall not be under any liability for loss of profit, business, revenues or any special indirect or consequential damage of any nature whatsoever or loss of anticipated saving or for any increased costs sustained by the client or his or her servants or agents arising in any way whether directly or indirectly as a result of reliance on this report or of any error or defect in this report.

1. EXECUTIVE SUMMARY

This report refers to work carried out as part of a rolling survey of process contaminants in UK retail foods. The report contains the results for concentrations of acrylamide and furans in food samples purchased between January 2017 and November 2017:

- A total of 271 samples (comprising multiple lots) were collected by an independent sampling contractor (Ventress Technical) from retail and fast food outlets in seven regions of the UK
- The selection of samples followed a core sampling and analysis plan from a previous acrylamide and furan survey (November 2011- December 2013).
- Samples were categorised in accordance with the requirements for the submission of data to EFSA¹.
- Where necessary, foods were cooked or prepared according to the manufacturers' guidelines prior to homogenisation and analysis.
- All analyses were carried out using accredited methods: a total of 269 tests were carried out for acrylamide and 120 for furans (furan, 2-methyl furan and 3-methyl furan).
- For this period, the number of products found to contain acrylamide levels that exceeded European Commission 'Indicative Values' (IV)² for their food category was 15.

3. INTRODUCTION

Acrylamide, furan and methyl furans (2-methyl furan, 3-methyl furan, 2,5-dimethyl furan) organic compounds produced naturally when some foods are subjected to high temperatures during cooking (including home-cooking) and processing. Regular and prolonged exposure over a lifetime to foods containing high levels of acrylamide and furan has the potential to increase the risk of developing cancer. Experts, including the international Joint Food and Agriculture Organisation and the World Health Organisation Expert Committee on Food Additives (JECFA), have previously concluded that current global levels of dietary exposure to acrylamide and furan indicate a human health concern³. The UK Food Standards Agency (FSA) has concluded that exposure to acrylamide and furan should be as low as reasonably achievable (ALARA). The FSA has produced advice for consumers in relation to acrylamide in food⁴.

3.1 Acrylamide

Acrylamide is a low molecular weight, water soluble organic compound with industrial applications such as the production of polyacrylamides. In 2002 Swedish scientists discovered acrylamide could form naturally during the preparation of (mostly) starchy foods as temperatures exceeded 120°C. Acrylamide is formed mainly from sugars and the amino acid asparagine, both of which are naturally present in foods. The chemical process that causes this occurs as a minor part of the so called Maillard Reaction; the Maillard Reaction is mainly responsible for the desirable colour and taste of food. Although acrylamide does not occur in foods subjected to lower temperatures and relatively short process times e.g. boiled potatoes, it has been found in a wide range of home-cooked and processed foods, including, bread, coffee, crispbreads, French fries and potato crisps.

3.2 Furan and methyl furans

Furan and methyl furans are volatile organic compounds that are also formed in certain foods during thermal processing. Furan is found in a variety of products, including coffee, prefabricated potato snacks and canned and jarred products which, during processing, have been subjected to a high temperature heat treatment (e.g. roasting, frying, canning etc). The methyl furans are also known to occur in foods, especially coffee. Furan can be formed in food from a variety of precursors naturally present in food (e.g. amino acids, β -carotene, dehydroascorbic acid, polyunsaturated fatty acids and their triglycerides, sugars and vitamin C) and some food additives (e.g. isoascorbic acid, E315) via complex steps which might involve oxidation or the Maillard reaction. The methyl furans have been shown to form in model reactions, similar to furan, from precursors commonly found in foods. Food characteristics, processing and cooking conditions, and losses of furans mainly due to evaporation during the preparation of food at consumer level, determine the final concentrations in food as consumed.

Furan has been classified by the IARC as a possible human carcinogen. Evidence indicates that the latter may occur via a genotoxic mechanism: The harmful effects of furan result from the formation of a reactive metabolite

³ Joint FAO/WHO Expert Committee on Food Additives (2010), Summary and conclusions of the Seventy-second meeting, Rome, 16–25 February 2010. Rome, FAO / WHO

⁴ http://www.food.gov.uk/safereating/chemsafe/acrylamide_branch/

in the body which can bind to cellular components such as DNA. The 2- and 3-methyl substituted furans are believed to be metabolically activated in a similar fashion as the parent furan.

In 2007, the European Commission recommended that member states should carry out monitoring for the presence of furan in heated foods⁵.

3.3 EC Recommendations

This survey was conducted in response to two European Commission Recommendations for pan-European activity on process contaminants: (i) European Commission Recommendation (EU) No. 2010/307 to investigate the levels of acrylamide in food, and in particular to monitor the effectiveness of acrylamide reduction measures as specified in the FoodDrinkEurope toolbox and (ii) European Commission Recommendation (EC) No. 2007/196, to monitor the occurrence levels of furan in foodstuffs.

3.4 European Food Safety Authority

As with previous surveys on acrylamide and furan, all data from this survey will be submitted to the European Food Safety Authority (EFSA). EFSA collates the acrylamide results with those from other Member States and, in the case of furan and methyl furans, these data will be used by EFSA as the basis of developing a risk assessment. EFSA publishes the acrylamide exposure assessments and trend analyses on their website⁶.

On 4th June 2015, EFSA published its Scientific Opinion on acrylamide in food⁷. EFSA agreed with the previous evaluations, that acrylamide in food has the potential to increase the risk of developing cancer. EFSA also considered possible harmful effects of acrylamide on the nervous system and male reproduction, and based on current levels of dietary exposure, these effects were not considered to be a concern. Further information on acrylamide can be obtained from the EFSA website.

In September 2017, EFSA published its Scientific Opinion on furan and methyl furans in food⁸. While an understanding of all the risks posed to health from the presence of furan and methyl furans in food was incomplete, EFSA has recommended that additional data is needed on the toxicity of methyl furans, their occurrence in foods and the effects of the distinct stages of coffee preparation on furan and methyl furans concentrations for all coffee types.

3.5 FSA Surveys

Information and results for all previous surveys can be accessed from the FSA website⁹.

⁵ Commission recommendation of 28 march 2007 on the monitoring of the presence of furan in foodstuffs. Oj L 88/56 29.3.2007

⁹ Available at: <https://www.food.gov.uk/science/acrylamide-0>

The results obtained from this 2017 survey form part of a longer term surveillance programme. It is expected that following the current survey period (2014-2018), further analyses of all data and trends regarding the levels of acrylamide and furan in UK retail foods will be carried out.

4. METHODS

4.1 Sampling

Prior to the commencement of sampling, the FSA agreed a detailed sampling plan with the analytical contractor (Premier Analytical Services) who was responsible for coordinating the purchase and collection of samples (via Ventress Technical). A total of 271 samples comprising multiple lots were purchased to cover the 11 Food categories in line with the requirements of EFSA¹⁰ and the European Commission¹¹: French fries / potato products sold as ready to eat (Categories 1 and 10) were obtained from restaurants, fast food outlets and chip shops; all other samples (Categories 2-11) were collected from a wide range of retail outlets including major and smaller supermarkets and independent retailers in the UK.

Details of the sampling plan are given in Table 6 of the appendices (see section 6).

4.2 Sample preparation and analysis

Samples received at the laboratory were prepared and stored according to the Food Standards Agency “Guidelines for undertaking surveys”¹². Potato products from food category 3 and Popcorn from food category 10 were cooked according to manufacturers’ guidelines prior to the determination of acrylamide; because of the volatile nature of the furans, coffee and coffee substitutes were tested before and after preparation for consumption according to manufacturer’s guidelines. Further details of the sample preparation procedures used are given in the appendices (see section 6.2 and Table 7 and Table 8).

Analysis of samples for the 2017 survey was carried out using UKAS accredited methods: the measurements of acrylamide, furan, 2-methyl furan and 3-methyl furan were based on the guidelines laid down in Commission Recommendations 2007/331/EC and 2007/196/EC. All test results were obtained from methods that used labelled isotope internal standards for recovery correction. Further details of the methods together with the analytical quality assurance procedures and measurement uncertainty can be found in the appendices (see sections 6.2 and 6.3).

5. RESULTS SUMMARIES

A total of 271 samples were collected over the period January 2017 - November 2017 for the analysis of acrylamide and furans in accordance with the test requirements given in Table 1.

Table 1. Summary of samples received (Jan 2017 - Nov 2017) and tests undertaken

Food category / sub category ¹³	Description	Number of samples received	Analyses

6.2 Sample preparation details and analytical methods

6.2.1 Sample preparation

All samples were prepared according to the Food Standards Agency “Guidelines for undertaking surveys”¹⁶. Where practical, digital images (samples and packaging) were recorded and all packaging retained.

Potato products for home cooking from category 3, bread (category 4) and popcorn (category 10) were cooked according to the manufacturers’ guidelines using domestic appliances e.g. oven, grill, deep fat fryer, microwave (see Table 7): Grills, ovens and deep fat fryers were equilibrated for approximately 10 minutes prior to cooking. Jacket potatoes were cooked in batches of 4 using a microwave while all remaining category 3 samples were cooked as a single layer of product on a baking tray (middle oven shelf) or mesh grill pan as appropriate; Pure sunflower oil was used for frying; bread was baked on the middle oven shelf; popcorn was cooked in batches of 6 x 70 g bags using a microwave.

Coffee and coffee substitute samples were prepared according to the manufacturers guidelines given on the packaging; retail domestic coffee preparation equipment was used as required, e.g. a cafetiere or espresso coffee maker (see Table 8).

6.2.1.1 Homogenisation

Samples requiring analysis of furan, e.g. jars and packets, were separated and retained for individual processing; coffee and coffee substitutes prepared for consumption were analysed immediately after the preparation cycle. These samples were not subjected to bulk homogenisation as this would have resulted in significant losses of volatile furan(s).

Where practical, entire samples (approximately 1kg) were homogenised using a food processor:

- Potato products from Categories 1, 3 and 10 and liquorice from category 11 were homogenized with water (1:2 sample/water w/w) using a high speed blender or food processor.
- Canned products were drained & stones removed prior to homogenization.
- A domestic cheese grater was used for the chocolate.
- Bread from category 4 was air-dried (weight loss recorded) prior to homogenising.
- Category 7 and 9 samples (ground/milled products) were mixed thoroughly prior to analysis
 - A coffee grinder was used for the whole coffee beans.

An aliquot of the homogenised sample was taken for analysis while the remainder was divided into four pots and stored at -18°C.

¹⁶ Guidelines for undertaking surveys. Available at:
<https://www.food.gov.uk/sites/default/files/multimedia/pdfs/fsasurveysguidance.pdf> [accessed June 2015]

6.2.1.2 Homogeneity testing

Representative samples from Categories 1-11 were selected at random and the homogeneity determined by replicate (6) sodium analyses. This was based on the assumption that both sodium and the analytes of interest had an equivalent distribution in these samples. Samples were confirmed as homogeneous by comparing the relative standard deviation (RSD) of the replicate measurements with that obtained from method control samples using a statistical F-test.

Samples (2-3 g) were treated with hot concentrated nitric acid prior to determination by atomic absorption spectroscopy on a PE 2100 (Perkin Elmer, USA) according to the procedure of Gorsuch¹⁷. Each batch was analysed with a blank and an in-house reference material.

Table 7. Details of the domestic cooking conditions

Category 3 – March 2017 samples

Sample code	Food sub-category code	Product description	Brand	Best before date	Date of cooking	Cooking conditions
17C-01457	3.1	Straight cut oven chips	Sainsbury's Be Good to Yourself	DEC 2018	21/04/2017	Oven190°C~23min

17C-01521	Organic instant cereal drink	Biona Organic Biomalt	04.19	16/01/2018	Freshly boiled water

6.2.2 Acrylamide analysis by GC-MS/MS

Acrylamide was determined as the brominated derivative, 2-bromopropenamide, according to the method of Hamlet and Sadd¹⁸.

Method performance (5 g sample, typical): limits of detection (LOD) and quantification (LOQ) were 0.5 and 3.0 µg/kg respectively; the estimated value for the method uncertainty (single determination) was: ±14% at 49 µg/kg (expanded relative uncertainty with a coverage factor of 2). A summary of the method performance data from this survey can be found in Table 9.

6.2.3 Analysis of furans by GC-MS

Furan, 2-methyl furan and 3-methyl furan were measured in samples using a headspace method based on the original procedure of Becalski *et al*¹⁹ with modifications according to Becalski *et al*^{20,21} and Shen *et al*²². Pre-chilled samples were homogenised at 3°C and an aliquot transferred to a headspace vial containing sodium chloride. Isotopically labelled furans (internal standards) were added and the samples incubated at 40°C prior to sampling the headspace for GC/MS analysis. Because of the volatile nature of the furans all samples were analysed in duplicate: either single analyses of duplicate packs or duplicate analyses of single packs (depending upon availability).

Method performance (10g sample, typical): The LOD and LOQ for all furans were 1 µg/kg and 2.5 µg/kg respectively (unless indicated otherwise in the results); the estimated uncertainty for a single determination over the concentration range 20-100 µg/kg furans was ±20% (expanded relative uncertainty with a coverage factor of 2). A summary of the method performance data from this survey can be found in Table 9.

6.3 Analytical quality assurance

All analyses were performed by trained staff in a UKAS accredited laboratory operating an internal audit and review process. All the test methods were all validated in-house and accredited by UKAS (ISO 17025).

Each batch of samples included a procedural blank and an In-House Reference Material (IHRM) or Certified Reference Material (CRM) and / or spiked sample. Method performance was monitored by assessing the data from IHRMs, CRMs and spiked reference materials in accordance with the rules governing Shewhart control charts²³ (this data is summarised in Table 9). The laboratory also participated in the FAPAS proficiency testing schemes available for acrylamide and furan (see Table 10). In addition, 10% of all samples were subjected to a repeat analysis: acceptance criteria for reporting of all results was for the duplicate measurement to be within $\pm 10\%$ of the first measurement.

Table 9. Summary of data obtained from the analysis of IHRM, CRM and spiked samples during this survey

(A) Acrylamide IHRM data

Reference material	Accepted value ($\mu\text{g/kg}$)				Measured values ($\mu\text{g/kg}$)			
	n	mean	range ^a	SE	n	mean	range	SE
IHRM Mar 16 ^b	7	22.1	16.3-27.9	0.73	15	21.1	18.0-24.9	0.49

^a upper and lower action limits; ^b dried cereal based material

(B) FAPAS CRM data

Reference material	Accepted value, (μ , $\mu\text{g/kg}$)	Measured values (x, $\mu\text{g/kg}$)			z- score ^a	
		n	mean	range	mean	range
CRM 3076 (French fries)	1151	4	1337	1333-1348	1.0	1.0-1.1

^a $z = (x - \mu) / \sigma$; $\sigma = 180$; acceptable z-score ≤ 2

(C) Acrylamide spike recovery data

Nominal spike range ($\mu\text{g/kg}$)	Recovery (%) ^a			
	n	mean	range	SE
50-835	13	98	86-107	1.4

^a the acceptable recovery range was 80-120%

²³ BS 7785:1994, ISO 8258:1991, Shewhart control charts, British Standards Institution. Available at: <http://www.bsonline.bsi-global.com/server/index.jsp>

(C) Furan spiked recovery data

Nominal spike level (µg/kg)	Recovery (%) ^a			
	n	mean	range	SE
Low spike ^b	16	100	83-114	2.0
High spike ^b	16	101	93-111	1.4

^a the acceptable recovery range was 80-120%; ^b spike range (determined by sample type / preparation e.g. as received / as consumed)

(D) 2-methyl furan spiked recovery data

Nominal spike level (µg/kg)	Recovery (%) ^a			
	n	mean	range	SE
Low spike ^b	13	97	86-107	1.8
High spike ^c	14	99	86-114	2.0

^a the acceptable recovery range was 80-120%; ^b spike range (determined by sample type / preparation e.g. as received / as consumed)

(E) 3-methyl furan spiked recovery data

Nominal spike level (µg/kg)	Recovery (%) ^a			
	n	mean	range	SE
Low spike ^b	14	93	82-103	1.8
High spike ^c	14	96	84-112	2.3

^a the acceptable recovery range was 80-120%; ^b spike range (determined by sample type / preparation e.g. as received / as consumed)

Table 10. FAPAS z-scores obtained during the survey period

Contaminant	Series	n	z-score	
			mean	range
Acrylamide ^a	30	5	0.2	-0.3 to 1.1
Furan ^b	30	2	0.7	0.4 to 1.0

^a Apr 2017 – Jan 18 ; ^b Feb 2017 – Feb 2018
