Executive summary

Between April 2020 and January 2022, the Food Standards Agency (FSA) commissioned a quarterly survey on consumer handwashing. Key findings from this survey are:

Across all waves of the handwashing tracker, participants were most likely to report washing their hands with soap and warm water. However, the proportion who reported handwashing with soap and warm water ‘always’ or ‘most of the time’ declined over time (79% April 2020, compared to 68% in January 2022).

Most participants reported washing their hands for between 20 and 24 seconds across all waves. However, the proportion who reported this significantly declined over time (was 35% in April 2020, down to 27% in January 2022).

Over time, there was a significant decrease in the proportion of participants who reported ‘always’ washing their hands in the following scenarios inside the home:

- Before cooking/preparing food (72% in April 2020, 62% in January 2022)
- Before eating (48% in April 2020, 42% in January 2022)
- After handling rubbish (73% in April 2020, 65% in January 2022)
- When arriving home, after a trip outside of the home (55% in April 2020, 47% in January 2022)

Reported handwashing after contact with animals (including pets) remained broadly stable over time. On average, across all waves, 36% of participants with a pet reported washing their hands ‘always’ after contact with animals, (whilst 26% reported doing this ‘most of the time’, 30% reported doing this ‘sometimes’ and 7% reported ‘never’ washing their hands after contact with animals).

Over time, there was a significant decrease in the proportion of participants who reported ‘always’ washing their hands in the following scenarios outside of the home:

- When eating a picnic (35% in July 2020, 29% in January 2022)
- When consuming a takeaway outside of the home (35% in July 2020, 30% in January 2022)
Since a peak in October 2020 (43%), the proportion of participants who reported ‘always’ washing their hands after blowing their nose, sneezing or coughing into their hands gradually declined and was significantly lower in January 2022 (35%).

The proportion of participants who reported ‘always’ washing their hands after using the toilet also declined over time. In April 2020 87% of participants reported ‘always’ washing their hands after using the toilet, decreasing significantly to 80% in January 2022.

Across all waves, most participants reported carrying and using hand sanitising gel as a hand washing alternative in a range of scenarios, but the proportion who reported doing this declined over time. For example:

- 55% of participants reported using hand sanitising gel after using public transport in October 2020, declining significantly to 44% in January 2022
- 54% of participants reported using hand sanitising gel when attending a social event in October 2020, declining significantly to 45% January 2022.
Background and Methodology

Background

The FSA has a vested interest in hand hygiene behaviours as poor hygiene can be a key contributor to foodborne disease (FBD), such as E Coli and norovirus, whilst good hand hygiene can reduce the risks of cross contamination. As a result, hand hygiene is included in the FSA’s business guidance. Guidance on consumer hand hygiene is available from the NHS, Public Health England (PHE) and Centers for Disease Control and Prevention (CDC), including information on when and how to wash hands.

The FSA has previously published qualitative and quantitative findings on handwashing during the pandemic, including findings from the first four waves (April 2020 – January 2021) of this quarterly handwashing tracker. This report summaries the latest findings from the tracker survey, providing commentary on key changes between the first and final waves of the quarterly handwashing tracker (April 2020-January 2022).

Methodology

In April 2020, the FSA commissioned Ipsos UK to conduct a quarterly tracking survey to measure consumer’s self-reported handwashing behaviour over a period of just under two years (from April 2020 until January 2022). This tracking survey provides self-reported information on:

- The frequency of handwashing behaviours in different scenarios inside and outside the home
- Handwashing practices (for example, handwashing methods, and time spent handwashing)
- The actions taken by participants when handwashing facilities are not available in a range of scenarios
- Demographic differences in handwashing behaviours
- Trends in handwashing behaviour over time

The quarterly handwashing tracker survey was conducted using Ipsos UK’s online i:Omnibus. In each wave of the survey, Ipsos UK surveyed a representative sample of approximately 2,000 adults aged 16-75 living in England, Wales and Northern Ireland.
(fieldwork dates and specific sample sizes available in Appendix 1). This report summarises findings across all eight waves of data, with the first quarterly survey conducted in April 2020 and the final wave conducted in January 2022.

Over the course of the data collection period, the restrictions imposed on the public varied because of rising and falling COVID-19 cases. Appendix 2 provides a summary of the changes in restrictions from March 2020 to March 2022. This contextual information should be considered carefully alongside the findings of this report, although it is not possible to make inferences about the impact of the restrictions on handwashing behaviour based on the tracker findings.

**Interpreting the data in this report**

Where appropriate, comparisons between waves found to be statistically significant at the 5% level are presented. This report does not provide commentary on demographic differences, but detailed demographic breakdowns are available in the published data tables, available to download via the [FSA data catalogue](https://example.com). Weighting is applied to the data, based on the overall profile of England, Wales and Northern Ireland with weights for region/nation, gender, age, social grade and working status. A full list of survey questions is provided in the Appendix 3. Survey questions were informed by handwashing guidance available from [NHS](https://nhs.uk), [PHE](https://phe.gov.uk) and [CDC](https://www.cdc.gov).

Base sizes are indicated beneath each figure in this report. In most cases the base is ‘all adults’ (aged 16-75 across England, Wales and Northern Ireland) who took part in the survey. Some survey waves took place when COVID-19 restrictions were still in place, restricting people’s ability to carry out normal day-to-day activities. In addition, some people may have not felt safe carrying out these activities, even when restrictions were not in place. For this reason, in some survey questions participants were given the option to report that ‘they were not doing this activity at the moment’. For these questions, participants who reported not doing the activity were removed from the base. The reduced base is noted beneath all relevant figures in this report (see figure 5 for

---

¹ The differences reported have no more than a five per cent probability of occurring by chance.
example). The data tables provide a full breakdown of respondents including those who reported that ‘they were not doing this activity at the moment’ for each question.

Results should be interpreted with care. All surveys are subject to a range of potential sources of error including sample imbalances which are not easily identified and corrected through weighting. Surveys are also subject to errors in respondents’ interpretation of survey questions and response options. The data reported within this report relies on respondents’ self-reported behaviours. Errors could occur due to imperfect recollection, or respondents’ tendency to overreport behaviours which are perceived as being desirable and underreport undesirable behaviours. The risk of these biases is greater in topics that are personal or sensitive in nature (such as hand hygiene).
Main findings

Handwashing methods

Handwashing guidance from [CDC](https://www.cdc.gov) states that handwashing should use either warm or cold water with soap. Guidance from [NHS](https://www.nhs.uk) and CDC state that use of hand sanitising gel should be used if you do not have access to soap and water.

Across all waves of the handwashing tracker, participants were most likely to report washing their hands with soap and warm water when compared to other methods (with water only, with hand sanitising wipes/gel, with soap and cold water). However, the proportion who reported handwashing with soap and warm water ‘always’ or ‘most of the time’ declined over time (79% April 2020, compared to 68% in January 2022). In contrast, handwashing with water only significantly increased over the same period (7% April 2020 to 12% in January 2022), although this has remained the least common method of handwashing throughout all waves of the tracker (Figure 1).

**Figure 1: Participants who reported washing their hands using various methods ‘always’ or ‘most of the time’ (April 2020 – January 2022)**

**Time spent handwashing**

Guidance from [NHS](https://www.nhs.uk) and [CDC](https://www.cdc.gov) indicates that handwashing should last for at least 20 seconds.

In the handwashing tracker survey, participants were asked how long they spend washing their hands each time they do so. Most reported washing their hands for between 20 and 24 seconds across all waves, however, the proportion who reported this significantly declined over time (from 35% in April 2020, to 27% in January 2022). The proportion of participants who reported washing their hands for one minute or more, or for 10 seconds or less also significantly increased (see Figure 2). Throughout the tracker, a sizeable proportion of participants also reported that they ‘don’t know’ how long they wash their hands for (Figure 2).
Figure 2: Reported time spent washing the hands each time – Quantitative handwashing tracker survey (April 2020 – January 2022)

Base: Online England, Wales and NI adults 16-75, 10-13 April 2020 (2,039), 10-14 July 2020 (2,068), 16-20 October 2020 (2,067), 15-18 January 2021 (2,062), 16-19 April 2021
Handwashing scenarios

Guidance from NHS and CDC states that handwashing should take place before/after a variety of scenarios. For example:

• after using the toilet or changing a nappy
• before and after handling raw foods like meat and vegetables
• before eating or handling food
• after blowing your nose, sneezing or coughing
• before and after treating a cut or wound
• after touching animals, including pets, their food or pet waste
• after touching garbage (rubbish)

CDC guidance also stated that during the COVID-19 pandemic, additional handwashing should also be done during the following scenarios:

• Before touching your eyes, nose, or mouth
• After touching your mask
• After leaving a public place
• After touching objects or surfaces that may be frequently touched by other people (for example, door handles and shopping carts)

The handwashing tracker survey asked participants about their handwashing in a variety of scenarios. The results below are divided into ‘inside the home’, ‘outside the home’ and ‘personal hygiene’.

Inside the home

Over time, there was a significant decrease in the proportion of participants who reported ‘always’ washing their hands in the following scenarios inside the home:

• before cooking/preparing food (72% in April 2020, 62% in January 2022)
• before eating (48% in April 2020, 42% in January 2022)
• after handling rubbish (73% in April 2020, 65% in January 2022)
• When arriving home, for example after a trip outside of the home (55% in April 2020, 47% in January 2022)

Figure 3 illustrates these trends over time. More detailed graphs (which include ‘most of the time/sometimes’ and ‘never’ responses) are included in Appendix 4.

Figure 3: Participants who reported ‘always’ washing their hands in different scenarios inside the home (April 2020 – January 2022)

Reported handwashing after contact with animals (including pets) remained broadly stable over time. On average, across all waves, 36% of participants with a pet reported washing their hands ‘always’ after contact with animals, whilst 26% reported doing this ‘most of the time’ and 30% reported doing this ‘sometimes’. On average across all waves, 7% of participants with pets reported ‘never’ washing their hands after contact with animals (Figure 4). Please note, comparable data is only available for this question from July 2020 onwards.
**Figure 4: Frequency of reported handwashing after contact with animals (including pets) (July 2020 - January 2022). Based on participants who reported having a pet.**

Base: Online England, Wales and NI adults who have a pet 16-75, 10-14 July 2020 (1,067), 16-20 October 2020 (1,017), 15-18 January 2021 (1,070), 16-19 April 2021 (1,056), 16-19 July 2021 (1,023), 15-19 October 2021 (1,054), 14-18 January 2022 (1,075). Values may not add to 100% as ‘not applicable’ responses are not shown. Comparable data not collected in April 2020.

**Outside the home**

Due to the changing COVID-19 lockdown restrictions, participants were asked about handwashing outside their home. For these survey questions participants could also select ‘I am not doing this activity at the moment’, and these participants were removed from results. Therefore, only participants who reported doing these activities at the time of the survey are included in these findings. This data is only available from July 2020 (Wave 2) onwards, as the option to select ‘I am not doing this activity at the moment’ was introduced from July 2020.

Over time, there was a significant decrease in the proportion of participants who reported ‘always’ washing their hands in the following scenarios outside of the home:
• when eating a picnic outside the home (35% in July 2020, 29% in January 2022)
• when consuming a takeaway outside of the home (35% in July 2020, 30% in January 2022)

The proportion of participants who reported ‘always’ washing their hands before eating in a restaurant significantly increased in October 2020 (49%), but otherwise remained relatively stable over time.

The proportion of participants who reported ‘always’ washing their hands before eating snacks with their hands gradually declined between July 2020 (30%) and October 2021 (25%) but increased slightly again in the final wave (28%, January 2022).

Figure 5 illustrates these trends. More detailed graphs (which include ‘most of the time/sometimes’ and ‘never’ responses) are included in Appendix 5.

**Figure 5: Participants who reported ‘always’ washing their hands in different scenarios outside the home (July 2020 – January 2022)**
Base: Online England, Wales and NI adults 16-75 who reported carrying out these activities at the time of data collection. Sample sizes for each wave are included beneath the graphs in Appendix 5. Data is only comparable from July 2020 onwards.

**Personal hygiene**

Participants were asked how often, if at all, they washed their hands after blowing their nose, sneezing or coughing into their hands. On average, across all waves 38% of participants reported ‘always’ washing their hands in this scenario. This proportion varied over time; 34% said they always washed their hands after blowing their nose, sneezing or coughing in April 2020, increasing significantly to 43% in October 2020. Since October 2020, the proportion decreased gradually over time, and was significantly lower in January 2022 (35%) than the peak in October 2020 (Figure 6).

---

2 Participants who reported ‘I am not doing this activity at the moment’ are excluded from the base.
The proportion of participants who reported ‘always’ washing their hands after using the toilet also declined over time. In April 2020 87% of participants reported ‘always’ washing their hands after using the toilet, decreasing significantly to 80% in January 2022. Meanwhile, the proportion of participants who reported washing their hands after using the toilet ‘most of the time’ significantly increased (8% in April 2020, 14% in January 2022) (Figure 7).
Barriers to handwashing

Sore hands

Participants were asked if they experienced sore hands because of handwashing. In April 2020, 51% of participants reported having sore hands because of handwashing, and this was the only wave where most participants said this was the case. In all other waves, most participants reported that they did not have sore hands due to handwashing. The proportion of participants who reported having sore hands was significantly higher in April 2020 (51%), January 2021 (43%) and April 2021 (48%) compared to the other waves but has remained stable since July 2021 (38%) (Figure 8).
Participants who reported having sore hands were asked how this impacted the frequency that they washed their hands. Across all waves, the majority of participants who experienced sore hands as a result of handwashing reported that it made ‘no difference’ to how frequently they washed their hands. The proportion who reported that it made ‘no difference’ to their handwashing significantly decreased over time (66% in April 2020, 51% in January 2022) (Figure 9).
Figure 9: Impact of sore hands on the frequency of handwashing (April 2020 – January 2022)

Base: Online British adults 16-75, with sore hands from washing 10-13 April 2020 (1,044), 10-14 July 2020 (835), 16-20 October 2020 (803), 15-18 January 2021 (913), 16-19 April 2021 (986), 16-19 July 2021 (790), 15-19 October 2021 (782), 14-18 January 2022 (841). Values may not add to 100% as ‘don’t know’ responses not charted.

Facilities being unavailable

Participants were asked if they ever noticed that handwashing facilities were unavailable in a range of locations outside their home. Across all reported survey waves (July 2020 – January 2022), takeaways were most likely to be reported as having handwashing facilities unavailable ‘most of the time’, or ‘always’ (50-55%). In all settings, at least a third of participants reported handwashing facilities to be unavailable or unusable ‘most of the time’ or ‘always’ across all waves (Figure 10). This indicates that a lack of handwashing facilities outside the home is a common issue for participants.
Figure 10: Participants who report handwashing facilities being unavailable or unusable 'most of the time' or 'always' in a range of scenarios outside the home – (July 2020-January 2022)

Base: Online England, Wales and NI adults 16-75 who reported carrying out these activities at the time of data collection: A table of sample sizes for each wave are included in Appendix 6. Data is only comparable from July 2020 onwards.

Participants were also asked what action they took, if any, when handwashing facilities were not available in the following scenarios:

- After using public transport
- Before drinking in a pub
- Attending a sports event
- Attending a social event

Across all waves (July 2020 – January 2022), most participants reported carrying and using hand sanitising gel as a hand washing alternative. The highest proportion reported using hand sanitising gel in October 2020, but the proportion of participants then significantly decreased over time. For example, 55% of participants reported using hand sanitising gel after using public transport in October 2020, declining significantly to 44% in January 2022. Similar trends are noted for all scenarios included in the tracker; before drinking in a pub (54% October 2020 vs 43% January 2022), attending a sports event (50% October 2020 vs 42% January 2022), attending a social event (54% October 2020 vs 45% January 2022) (Figure 11).

3 participants who reported ‘I am not doing this activity at the moment’ or ‘not applicable’ are excluded from the base.
Figure 11: Participants who reported carrying and using hand sanitising gel in a range of scenarios when handwashing facilities are unavailable (July 2020 – January 2022)

Base: Online England, Wales and NI adults 16-75 who reported carrying out these activities at the time of data collection\(^4\): A table of sample sizes for each wave are included in Appendix 7. Data is only comparable from July 2020 onwards.

Meanwhile, the proportion of consumers who reported that they ‘take no action and live with it’ when handwashing facilities were unavailable increased significantly over time in all scenarios. For example, 8% of participants reported that they ‘take no action and live with it’ after using public transport in July 2020, increasing significantly to 12% in January 2022. Similar trends are noted for all scenarios included in the tracker; before drinking in a pub (12% vs 20%), attending a sports event (10% vs 16%), attending a social event (8% vs 12%) (Figure 12).

\(^4\) participants who reported ‘I am not doing this activity at the moment’ or ‘not applicable’ are excluded from the base.

Base: Online England, Wales and NI adults 16-75 who reported carrying out these activities at the time of data collection⁵: A table of sample sizes for each wave are included in Appendix 7. Data is only comparable from July 2020 onwards.

Some participants also reported carrying and using wet wipes/tissues, or washing their hands at the next available opportunity, but these figures do not show significant changes over time. Detailed graphs are available in appendix 8 for further information.

**Conclusion**

This tracking survey indicates that a variety of hand hygiene behaviours were high earlier in the tracker (particularly in April, July and October 2020). Since then, many handwashing behaviours have declined over time (to January 2022) including the frequency of handwashing and the use of hand sanitising gel in a range of scenarios.

⁵ participants who reported ‘I am not doing this activity at the moment’ or ‘not applicable’ are excluded from the base.
This indicates that some handwashing behaviours established during the COVID-19 pandemic have declined.

There are a small number of scenarios where minimal changes were noted over time, for example handwashing after handling pets. It is possible that these handwashing habits were ingrained and not influenced by the pandemic, which would explain why they have remained consistent over time.

|               | All students return to face-to-face education.  
|               | No indoor mixing between different households allowed. |
| May 2021      | Mid-May - indoor venues reopen, including pubs and restaurants.  
|               | Limit of 30 people allowed to mix outdoors in England. |
| July 2021     | 19 July - all legal limits on social contact removed and the final closed sectors of the economy reopen. |
| August 2021   | Wales: no legal limits on social contact. |
| December 2021 | Omicron variant. ‘Plan B’ measures in England introduced (face masks compulsory in most public venues, NHS Covid Pass mandatory in specific settings) and work from home guidance reintroduced. |
| January 2022  | England to move to ‘Plan A’ (face coverings no longer compulsory, including in schools). Restrictions in other nations lifted. Work from home guidance lifted. Isolation period reduced from seven to five days. |
| February 2022 | England: all Covid restrictions lifted.  
|               | Wales: Facemasks no longer compulsory in all settings.  
|               | Northern Ireland: remaining restrictions lifted. |
| March 2022    | Covid travel rules end.  
|               | Wales: Face coverings only required in health and care settings. |

**Appendix 3: Survey questions**

The list of survey questions provided is based on the most recent collection (Survey wave 8, January 2022). Some small changes were made to the survey between survey waves 1 (April 2020) and survey wave 2 (July 2020), these are denoted in footnotes.
Since survey wave 2, the questions have remained consistent. Full survey scripts for each wave are available on request.

1) Thinking about when you are at home at the moment. How often, if at all, do you wash your hands? Please select one answer for each statement.

- a) Before cooking a meal or preparing food
- b) Before eating
- c) After contact with animals, including pets
- d) After handling rubbish
- e) When you get home, for example, after a trip out of your home

   i. Never
   ii. Sometimes
   iii. Most of the time
   iv. Always
   v. Not applicable

2) Thinking about when you are at home at the moment, how often do you wash your hands in each of the following ways? Select only one per statement

- a) With water on its own
- b) With soap/handwash and warm water
- c) With soap/handwash and cold water
- d) With hand sanitising wipes or gel

   i. Never
   ii. Sometimes
   iii. Most of the time
   iv. Always
   v. Prefer not to say

---

6 ‘Prefer not to say’ option was added in Wave 2. In wave 1, this option was ‘Not applicable’.
3) Thinking about when you are at home at the moment. How many seconds do you spend washing your hands each time?\textsuperscript{7}  \textit{Please type your answer using whole numbers (whole numbers only no ranges)}

4) Thinking about eating outside of your home at the moment. How often, if at all, do you wash your hands, or use hand sanitising wipes or gels before eating in the following situation?\textsuperscript{8}  \textit{Please choose one per situation}

\begin{itemize}
  \item a) a picnic outside of the home
  \item b) eating in a restaurant
  \item c) consuming a take-away outside of the home
  \item d) eating snacks (like crisps, nuts, raisins or an ice cream) with your hands outside of the home
  \begin{itemize}
    \item i. Never
    \item ii. Sometimes
    \item iii. Most of the time
    \item iv. Always
    \item v. I am not doing this activity at the moment
  \end{itemize}
\end{itemize}

5) Does frequently washing your hands result in you having sore hands? \textit{Please select only one}

\begin{itemize}
  \item a) Yes – to go Q6
  \item b) No – skip to Q7
\end{itemize}

\textsuperscript{7} In wave 1, question 3 was: ‘When you are at home, typically how many seconds do you spend washing your hands each time?’

\textsuperscript{8} In wave 1, question 4 was: ‘When eating outside of the home, how often, if at all, do you wash your hands, or use hand sanitising wipes or gels, before eating?’. The question in wave 1 did not ask about specific situations, and response options were: ‘Never, Sometimes, Most of the time, Always, Only when eating food without cutlery, Don’t know’
6) [Only ask if ‘yes’ at Question 5] What impact, if any, does getting sore hands have on the frequency with which you wash your hands? Please select only one

a) I wash my hands a lot more often
b) I wash my hands a little more often
c) It makes no difference to how often I wash my hands
d) I wash my hands a little less often
e) I wash my hands a lot less often
f) I avoid washing my hands
g) Don’t know

7) At the moment, how often, if at all, do you wash your hands …? Please select one answer for each statement.

a) After blowing your nose, sneezing or coughing into your hands
b) After using the toilet

   i. Never
   ii. Sometimes
   iii. Most of the time
   iv. Always
   v. Prefer not to say

8) At the moment what action, if any, do you usually take if handwashing facilities are not available? Please select one answer for each situation

9 In wave 1, question 7 was: ‘How often, if at all, do you wash your hands… a) After blowing your nose, sneezing or coughing into your hands? b) After using the toilet?’
10 ‘Prefer not to say’ option was added in Wave 2. In wave 1, this option was ‘Not applicable’.
11 In wave 1, question 8 was: ‘If you find yourself in a place where handwashing facilities are not immediately available (for example, after using public transport, drinking in a pub, attending a live sports event), what action, if any do you usually take?’.
a) after using public transport
b) before drinking in a pub
c) attending a sports event
d) attending a social event

i. I don’t take any action and live with it
ii. I carry and use hand sanitising gel
iii. I carry and use wet wipes or tissues
iv. I wash my hands at the next available opportunity
v. I am not doing this activity at the moment

9) How often, if at all, do you find handwashing facilities are not available, or not usable, in the following places at the moment?\textsuperscript{12} \textit{Please select one answer for each place}

a) takeaways
b) cafes and restaurants
c) pubs/clubs
d) sports and music events
e) cinema and theatre venues
f) public toilets

i. Never
ii. Sometimes
iii. Most of the time

\textsuperscript{12} In wave 1, question 9 was: ‘Typically, how often, if at all, do you find handwashing facilities are not available or not usable in the following places?’.
iv. Always
v. I am not doing this activity at the moment

10) As part of your current job role, do you handle open food? (This might be a voluntary or paid role). By open food, we mean food products or ingredients that will be consumed by other people which are not protected by packing. *Please select only one*

a) Yes – I am currently in a role that handles food
b) Yes - but I'm not working due to furlough
   c) No

11) Do you have any pets at home? *Please select only one*

a) Yes
b) No

---

13 ‘I am not doing this activity at the moment’ option was added in Wave 2. In wave 1, this option was ‘Not applicable’.
14 Question 10 was added from Wave 2
15 Question 11 was added from Wave 2
Appendix 4: Detailed graphs for handwashing inside the home

Figure 13: Frequency of reported handwashing before cooking/preparing food (April 2020 - January 2022) including ‘always’, ‘most of the time/sometimes’ and ‘never’ responses

Base: Online England, Wales and NI adults 16-75, 10-13 April 2020 (2,039), 10-14 July 2020 (2,068), 16-20 October 2020 (2,067), 15-18 January 2021 (2,062), 16-19 April 2021 (2,049), 16-19 July 2021 (2,051), 15-19 October 2021 (2,017), 14-18 January 2022 (2,066). Values may not add to 100% as ‘not applicable’ responses are not shown.
Figure 14: Frequency of reported handwashing before eating food (April 2020 - January 2022) including ‘always’, ‘most of the time/sometimes’ and ‘never’ responses

Base: Online England, Wales and NI adults 16-75, 10-13 April 2020 (2,039), 10-14 July 2020 (2,068), 16-20 October 2020 (2,067), 15-18 January 2021 (2,062), 16-19 April 2021 (2,049), 16-19 July 2021 (2,051), 15-19 October 2021 (2,017), 14-18 January 2022 (2,066). Values may not add to 100% as ‘not applicable’ responses are not shown.
Figure 15: Frequency of reported handwashing after handling rubbish (April 2020 - January 2022) including ‘always’, ‘most of the time/sometimes’ and ‘never’ responses

Base: Online England, Wales and NI adults 16-75, 10-13 April 2020 (2,039), 10-14 July 2020 (2,068), 16-20 October 2020 (2,067), 15-18 January 2021 (2,062), 16-19 April 2021 (2,049), 16-19 July 2021 (2,051), 15-19 October 2021 (2,017), 14-18 January 2022 (2,066). Values may not add to 100% as ‘not applicable’ responses are not shown.
Figure 16: Frequency of reported handwashing when returning home from a trip outside the home (April 2020 - January 2022)

Base: Online England, Wales and NI adults 16-75, 10-13 April 2020 (2,039), 10-14 July 2020 (2,068), 16-20 October 2020 (2,067), 15-18 January 2021 (2,062), 16-19 April 2021 (2,049), 16-19 July 2021 (2,051), 15-19 October 2021 (2,017), 14-18 January 2022 (2,066). Values may not add to 100% as the “Not applicable” option is not charted.
Appendix 5: Detailed graphs for handwashing outside the home

Figure 17: Participants who reported washing their hands ‘always’, ‘most of the time/sometimes’ and ‘never’ when eating a picnic outside the home (July 2020 – January 2022)

Base: Online England, Wales and NI adults 16-75 who reported carrying out these activities at the time of data collection\(^\text{16}\). 10-14\(^{th}\) July 20 (1,139), 16-20\(^{th}\) Oct 20 (1,114), 15-18\(^{th}\) Jan 21 (1,041), 16-19\(^{th}\) Apr 21 (1,300), 16-19\(^{th}\) Jul 21 (1,473), 15-19\(^{th}\) Oct 21 (1,409), 14-18\(^{th}\) Jan 22 (1,413). Comparable data available from July 2020 only.

\(^{16}\) participants who reported ‘I am not doing this activity at the moment’ are excluded from the base.
Figure 18: Participants who reported washing their hands ‘always’, ‘most of the time/sometimes’ and ‘never’ when eating in a restaurant outside the home (July 2020 – January 2022)

Base: Online England, Wales and NI adults 16-75 who reported carrying out these activities at the time of data collection\textsuperscript{17}. 10-14\textsuperscript{th} July 20 (1,049), 16-20\textsuperscript{th} Oct 20 (1,365), 15-18\textsuperscript{th} Jan 21 (1,085), 16-19\textsuperscript{th} Apr 21 (1,278), 16-19\textsuperscript{th} Jul 21 (1,600), 15-19\textsuperscript{th} Oct 21 (1,664), 14-18\textsuperscript{th} Jan 22 (1,736). Comparable data available from July 2020 only.

\textsuperscript{17} participants who reported ‘I am not doing this activity at the moment’ are excluded from the base.
Figure 19: Participants who reported washing their hands ‘always’, ‘most of the time/sometimes’ and ‘never’ when consuming a takeaway outside the home (July 2020 – January 2022)

Base: Online England, Wales and NI adults 16-75 who reported carrying out these activities at the time of data collection\(^{18}\). 10-14\(^{th}\) July 20 (1,114), 16-20\(^{th}\) Oct 20 (1,173), 15-18\(^{th}\) Jan 21 (1,133), 16-19\(^{th}\) Apr 21 (1,335), 16-19\(^{th}\) Jul 21 (1,457), 15-19\(^{th}\) Oct 21 (1,475), 14-18\(^{th}\) Jan 22 (1,510). Comparable data available from July 2020 only.

\(^{18}\) participants who reported ‘I am not doing this activity at the moment’ are excluded from the base.
Figure 20: Participants who reported washing their hands ‘always’, ‘most of the time/sometimes’ and ‘never’ when eating snacks outside the home (July 2020 – January 2022)

Base: Online England, Wales and NI adults 16-75 who reported carrying out these activities at the time of data collection. 10-14th July 20 (1,338), 16-20th Oct 20 (1,434), 15-18th Jan 21 (1,279), 16-19th Apr 21 (1,552), 16-19th Jul 21 (1,674), 15-19th Oct 21 (1,648), 14-18th Jan 22 (1,701). Comparable data available from July 2020 only.

19 participants who reported ‘I am not doing this activity at the moment’ are excluded from the base.
