# 1.Executive summary

FSA/FSS have reviewed an assessment of application RP1566 for the renewal authorisation of genetically modified (GM) insect-resistant soybean MON 87701 x MON 89788 for food and feed uses, import and processing.

This GM application has been made to renew the authorisation in Great Britain (GB) as it is 10 years since the stacked event was authorised and placed on the market in the EU. The same event has been authorised for food and/or feed use in 17 other territories worldwide as the information and data demonstrate that the regulatory science and safety criteria are satisfied according to the regulatory requirements in those territories. This Genetically Modified Organism (GMO) had its authorisation renewed by European Food Safety Authority (EFSA) in 2022.

FSA/FSS have reviewed the information provided by the applicant and the EFSA renewal Opinion<sup>1</sup> and confirmed that genetically modified soybean MON 87701 x MON 89788, as described in this application, is unlikely to have any adverse effect on human or animal health or on the environment in the context of its intended uses in GB.

## 2.Background and purpose of review

In accordance with assimilated EU Regulation 1829/2003<sup>2</sup> on genetically modified food and feed, the application RP1566 for the renewal of authorisation of genetically modified soybean MON 87701 x MON 89788, has been submitted for authorisation in each nation of Great Britain (GB).

Whilst it was a Member State of the EU, the UK accepted the risk assessments of the European Food Safety Authority (EFSA) in respect of authorisations for regulated food and feed products. When GB left the EU, it retained the same regulations for food and feed regulated products; FSA/FSS also adopted equivalent technical guidance and quality assurance processes to be able to undertake GB risk assessments for regulated product applications.

To ensure our regulatory systems are risk proportionate and resources are used effectively, FSA/FSS have used the evidence submitted by the applicant and other information in the public domain, including the EFSA Scientific Opinion, to provide a summary assessment of the evidence of safety presented in this report.

Specifically, in reviewing the risk assessment that EFSA have recently completed, the reviewers have verified that the standard approach taken, when compared to the relevant guidance is appropriate for GB and the conclusions made are consistent with the data summarised in the Opinion. Consideration has been given to the processes undertaken by EFSA to ensure that the Opinion is robust and whether there are any aspects that would require further review, such as specific issues for the countries of the UK. The conclusion of the assessment is that there is sufficient evidence of safety to conclude without requiring further risk assessment activities at this time.

## 2.2 Source/organism

Soybean (*Glycine max L.*) containing two-event stack.

## 2.3 Genetic modification step

MON 87701 x MON 89788 soybean was produced by traditional crossing of MON 87701 and MON 89788 single event lines. No new genetic modification was therefore performed to produce the stack.

The single events that comprise stacked MON 87701 x MON 89788 soybean are:

- MON 87701 consisting of a *cry1Ac* expression cassette, encoding the Cry1Ac protein from *Bacillus thuringiensis*. The Cry1Ac protein confers resistance against specific lepidopteran pests such as velvet bean caterpillar (*Anticarsia gemmatalis*), soybean looper (*Pseudoplusia includens*), soybean anvil borer (*Epinotia aporema*) and sunflower looper (*Rachiplusia nu*).
- MON 89788 consisting of a *cp4 epsps* expression cassette, encoding the CP4 EPSPS protein from *Agrobacterium tumefaciens*, conferring tolerance to glyphosate herbicide.

## 3. Details of other regulators' opinions

This stacked event has been authorised for food and/or feed use in 17 other territories worldwide.

Specifically, reviewing the EFSA risk assessment (2022) and renewal data provided by the applicant, it was found that there is no evidence for new hazards, modified exposure or scientific uncertainties that would change the conclusions of the original risk assessment on soybean MON 87701, which were that MON 87701 x MON 89788 soybean is “as safe as the conventional counterpart and the tested non-GM reference varieties with respect to potential effects on human and animal health and the environment”.

### **3.1 Methodology applied in the EFSA Opinion**

EFSA GMO Panel (EFSA Panel on Genetically Modified Organisms), 2015. Guidance for renewal applications of genetically modified food and feed authorised under Regulation (EC) No 1829/2003 <sup>3</sup>.

### **3.2 Specification**

In accordance with Commission Regulation (EC) No 65/2004 <sup>4</sup>, the unique identifier for MON 87701 x MON 89788 soybean is MON-877Ø1-2 x MON89788-1.

Information provided on the identity, composition and specification of the plant does not raise safety concerns. In the context of this renewal application, new bioinformatics analyses were provided to assess the potential interruption of endogenous soybean genes. Results confirmed previous conclusions which did not identify interruption of endogenous genes.

### **3.3 Exposure assessment**

EFSA undertook an exposure assessment as part of their Scientific Opinion. In order to verify if it was still relevant for GB, data from National Diet and Nutrition Survey databases were reviewed by FSA/FSS, showing UK soy consumption has increased in the last few years but remains lower than several European countries. These data confirm the suitability of the risk assessment for GB use.

### **3.4 Toxicological data**

Updated bioinformatics analyses did not identify any similarities with known toxins or allergens. No new safety concerns were identified from the literature review.

### **3.5 Analytical Method Review**

FSA/FSS accepted the European Union Reference Laboratory for Genetically Modified Food and Feed (EURL GMFF) report, showing that the detection method for MON 87701 x MON 89788 <sup>5</sup> was previously validated and declared fit for purpose.

### **3.6 Post Market Environmental Monitoring Plan (PMEM)**

FSA/FSS reviewed and accepted the EFSA GMO Panel conclusions about the PMEM plan proposed by the applicant for soybean MON 87701 x MON 89788, considering the scope consistent with the intended uses. FSA/FSS accepted the proposed PMEM plan and did not require additional monitoring.

### **3.7 Proposed labelling**

The applicant proposed no additional labelling of MON 87701 x MON 89788 soybean on the basis that it is equivalent to the conventional counterparts, and its intended use is the same as for conventional soybean. The FSA/FSS accept the applicant's conclusion and do not require specific or additional labelling.

## **4. Other regulators opinion and conclusions**

EFSA (2022) found that there is “no evidence for new hazards, modified exposure or scientific uncertainties that would change the conclusions of the original risk assessment” for this stacked event, herein denoted as Soybean MON 87701 x MON 89788. The conclusions of the original EFSA risk assessment, that Soybean MON 87701 x MON 89788 is “as safe as the conventional counterpart and the tested non-GM reference varieties with respect to potential effects on human and animal health and the environment”, therefore remain unchanged.

It is noted that Soybean MON 87701 x MON 89788 is not authorised for cultivation in the UK/EU. “Accidental release of viable GM soybean would not cause an environmental safety concern and as with conventional soybean varieties, would be unlikely to persist under European environmental conditions”. No post market

monitoring of food and feed is necessary. The proposed PMEM plan was acceptable and did not require extra monitoring.

## **5. Caveats and uncertainties**

No caveats and uncertainties were identified.

## **6. FSA/FSS Conclusion for GB risk analysis**

The application has been assessed in line with the applicable guidance<sup>3</sup> and is partially based on considerations of detailed proprietary information available to the Panel. Whilst this is only briefly summarised this description is consistent with the conclusions. The conclusions of the EFSA Opinion have been reviewed in detail by FSA/FSS and are considered appropriate and applicable to GB.

## **7. Outcome of assessment**

FSA/FSS have reviewed the applicant's renewal application, supporting documentation, and other regulators' risk assessments, most notably the EFSA Scientific Opinion (2022) and consider sufficient evidence has been provided to conclude without further questions or risk assessment activities.

The environmental and human safety of soybean MON 87701 x MON 89788 has been well characterised by the applicant under the Annex II to the Cartagena Protocol. FSA/FSS therefore accept the conclusion that soybean MON 87701 x MON 89788 poses no increased risk to conservation and sustainable use of biodiversity, or to human or animal health in terms of allergenicity or toxicity compared to conventional soybean.

FSA/FSS conclude that genetically modified soybean MON 87701 x MON 89788, as described in this application, poses no new hazards, modified exposure or scientific uncertainties that would change the conclusions of the original risk assessment.

In making this assessment the following principles have been applied:

- 1) There is no legal duty to perform a separate risk assessment for GB and there was sufficient scientific evidence to make a conclusion on safety with no further questions to the applicant, and therefore no further risk assessment activities are necessary.
- 2) The application is for a renewal or authorisation where the UK/GB already has accepted the established risk of the products on the market.
- 3) Sufficient evidence was available in the literature, for example, where other National food safety authorities had positively assessed the application using the same risk assessment guidance in principle and legal requirements in GB with the exception to changes in the General Food Law.
- 4) Applicants provided sufficient relevant information as requested by FSA/FSS.
- 5) The FSA/FSS review did not find any issues of divergence from guidance or mutual approaches or new scientific issues for consideration.
- 6) There were no other specific issues that would require an assessment for the UK or the nations of the UK.
