The Public's Interests, Needs and Concerns Around Food in Northern Ireland

Qualitative and Quantitative Evidence on Public Interests, Needs and Concerns around Food in Northern Ireland

Conducted for the Food Standards Agency and Food Standards Scotland by Bright Harbour, in partnership with Esposito Research & Strategy and AndGood

Preface

A Northern Ireland focus, drawing on UK-wide data and reporting

This research was commissioned by the Food Standards Agency (FSA) and Food Standards Scotland (FSS) to provide a detailed ‘snapshot’ of people’s interests, needs and concerns around food. It explores what key food interests the public would like to see represented and protected on their behalf - in relation to food hygiene and safety but also more widely.

The main report for this piece, and the overall ‘story’ of project findings, draws on UK-wide data. This included qualitative research with 95 participants; a nationally representative survey of 6,175 UK respondents; input expertise from a ‘People’s Voice Board’; and input from academic Dr Christian Reynolds (Centre for Food Policy at City, University of London).

The below report highlights Northern Ireland specific data. In general, the ‘picture’ in Northern Ireland is very similar to that reported in the wider data. Where useful, significant differences from the quantitative survey have been noted, and additional qualitative detail has been added to contextualise any regional differences in experiences or views.

A comprehensive view of public interests around food, building on previous evidence

In many ways, the topics, public needs and interests represented in this report are not ‘new’. The concerns and priorities it documents are largely well evidenced in previous FSA/FSS and wider research over the last decade or more. Citations to this foundational evidence are included throughout. However, the shape, intensity and breadth of these interests has varied and evolved, particularly under the rapid and deep change of the last few years - in ways that policy-makers will need to be
aware of and account for in order to effectively represent and protect the public interest.

**Key contextual drivers of public attitudes and views**
The time and context of this work have shaped public experiences and views on multiple levels, as summarised below. Individually, each of these contextual drivers are complex, powerful and nuanced. Collectively, they reflect profound changes to public context generally and around food. We ask readers to keep this wider context of change, uncertainty and instability as shaping the views expressed in this report.

**Public priorities are complex, fluid and multi-layered**

As in previous FSA research, the public’s experiences, views and concerns around food reported here are complex and multi-layered. People’s food worlds are experienced holistically, as are priorities and concerns related to food affordability, quality, health, ethics and so on. This can be a challenge for policy-makers who typically operate in more clear-cut ‘issue siloes’, as public concerns and interests rarely exist in isolation.

Public priorities around food are also extremely fluid - even contradictory. People’s views about ‘what matters’ shifts depending on their focus: immediate and personal needs and challenges on a typical day - or the more abstract and long-term (the future, the environment, and so on).

To aid the reader, after establishing contextual factors that shape views and needs across issue areas, ‘wider interests’ are discussed broadly in the order of public importance - flowing from the immediate to the longer-term. However, we ask the reader to remember that in practice, ‘ranked’ priorities were less clear cut. Unsurprisingly, people want support both for now and for the future; for policy-makers to support both their immediate and longer-term interests.
Thank you
To the members of our People's Voice Board for guiding this process throughout: sharing your lived experience; acting as our conscience around inclusivity and public respect; and reviewing materials and findings to ensure they felt fair and accessible.
Executive Summary

Introduction

The Food Standards Agency and Food Standards Scotland have a long-standing history of open policy-making, founded in rich evidence gathering and participatory discussions with the UK public about their experiences, needs, interests and concerns around food.

As a result, these agencies have amassed a substantial, evolving evidence base about public priorities and interests around food safety and hygiene issues - but also wider interests that shape public food worlds. FSA and wider research has clearly shown that the UK public care deeply about a wide range of ‘wider interests’ - including health and nutrition; environment and ethics; consumer versus ‘business’ power; our potential ‘food futures’; and so on.

This research was commissioned to build on this evidence, providing up-to-date insights on the ‘wider interests’ around food that the public want represented and protected on their behalf. It explored the views of both the ‘general public’ as well as groups that are traditionally less heard by policy-makers.

Method and Sample

Data were gathered using multiple methods over several stages of research - including a total of 95 qualitative participants (12 in Northern Ireland) and 6175 survey respondents (478 in Northern Ireland).

- A rapid mapping of existing evidence shaped project objectives and materials
- A ‘People’s Voice Board’ of 8 UK people guided the project throughout.
75 ‘general public’ participants were engaged in qualitative research via group workshops, remote ethnography tasks, and 1-1 depth interviews

20 ‘targeted groups’ participants were engaged via mix of depth interviewing and remote ethnography, boosting understanding of typically ‘less heard’ groups

A nationally representative online survey, reaching 6175 respondents across the four nations of the UK validated and extended qualitative research findings

Key findings: Contextual Drivers Shaping Public Interests and Concerns

Below we present contextual issues and challenges that shaped public interests, attitudes and needs across different ‘issue’ spaces - such as food safety and hygiene, health and nutrition, and ethics and environment issues. These wider contextual drivers of public experiences and needs must be taken into account by policymakers seeking to support the public's ‘wider interests' around food, in order to ensure that policies engage with the realities of people’s lives.15

Key findings in detail:

This research evidences several areas in which our current food systems are judged as working well. For example, people generally feel their food is safe and hygienic; most have access to a degree of choice they are satisfied with; the public feel they know enough about how to keep themselves safe and well.

However, there was also a widespread sense that the food system is not working as well as it should for the UK public - particularly for those less financially secure. Concerns related to these perceived ‘imbalances’ and ‘unfairnesses' in the system were often more dominant in people’s minds than the elements they felt were going well.
This sense of pressure seemed higher overall for people in Northern Ireland as compared to the UK overall, and indeed compared to some other devolved nations (Wales) - across both the qualitative and quantitative research. There was a sense of people feeling under more price pressure, less supported by UK Government representatives, and more exposed to changes and uncertainties brought by Brexit and Covid.

“Northern Ireland has much lower wages than England but the food prices are the same... We are part of the UK but then a lot of the UK things affect us and then some don’t (esp Covid rules)... Are we together or not? They can’t make up their mind.” F, 46, D, Children Under 18, Mobility Issues, Suburban Northern Ireland

Many felt pressured and unsupported in relation to their food choices

- People found it difficult if not impossible to ‘juggle’ competing drivers (for example price, value, budget, convenience, health and so on) - and to make choices that align with both their short-term and long-term interests and concerns.
- There was a sense that ‘no choice is perfect’: the tasty meal may not be healthy; the quality meal is too expensive; the healthy meal takes too long to make; and so on.
- Price often won out as a driver of food choices, leading many to make compromises that feel uncomfortable - around health, environment, wider ethical values, but also for those who are most pressured around 'basics' like safety or even sufficiency.
- Many also found it harder than they would like to access trustworthy information and guidance to shape their food choices - making it harder to navigate these pressures.
Existing concerns seem to have been amplified by wider uncertainty and pressure

- Wider contextual uncertainty and pressure had a negative impact that was evident across all nations of the UK, equally in rural and urban areas, and across all levels of society - including amongst people from Northern Ireland.
  - Only 56% in Northern Ireland (vs. 53% UK average) of survey respondents agreed that they felt ‘optimistic about the future’.
  - In some qualitative groups, financial pressures in particular were causing visible distress, with some groups being stopped for participant care reasons.
- Concerns seemed to be amplified by an increasing lack of trust that key food decision-makers have their best interests at heart.
  - The public worried that our food systems and decision-makers (including food businesses and Government) prioritise profit over people.
  - Participants tended to feel business was the most powerful force in shaping our food systems, and 64% of survey respondents in Northern Ireland (significantly higher than the UK average of 56%) expressed concern for the future over ‘the power of big food manufacturers and retailers’.
  - Trust in Government decision-makers was even lower. Only 32% of people reported trusting the Government to ‘act in their best interests’ (the same as the UK average). Only 15% saw the Government and 10% saw local authorities as a trusted ‘source of information about food’ (versus 14% and 11% UK average, respectively).
  - Note that the specific role of the food regulator (FSA/FSS) in the food system was not discussed in depth. In previous research the FSA has tended to attract high trust scores.\footnote{16}

Food security was under threat, particularly amongst more marginalised groups
Most people were feeling at least some level of financial pressure around food choices. Food prices were a ‘flashpoint’ of deep public concern and worry.

- 22% in Northern Ireland (vs. 20% UK average) spontaneously mentioned food prices as an area of future concern - well ahead of any other spontaneous mentions.
- Whilst people on higher incomes have more agency and are better able to afford food that fits their values and have greater access to wider choice, many have also experienced rising costs, food shortages and/or increasing financial pressure or uncertainty.
- Prompted concern levels were even higher, with 80% selecting food prices as a major concern for the future of food across all UK nations (this is significantly higher than the UK average of 76%).
- A majority of people (74% in Northern Ireland vs. 65% UK average) have modified their food behaviours as a result of financial concerns; only 48% (vs. 52% UK average) said they are able to afford the quality of food they want at all times (down to 30% vs. 38% UK average among those on lowest income).

Many are food insecure - in ways that mirror existing social-inequalities:

- Worryingly, 31% (vs. 28% UK average) of respondents in Northern Ireland reported behaviours associated with low or very low food security. For example: reduced quality or variety of food, not eating when hungry, or skipping meals for financial reasons. These are much more prevalent among those on lower incomes or facing other socio-economic challenges.
- Within the wider UK sample, low or very low food security was more prevalent among those on lower incomes; Millennial and Gen Z respondents; people living in larger households; and for Asian, Black, African and Caribbean people.
Key findings in detail: The Public’s ‘Wider Interests’ around Food

As noted in the preface, the public’s needs and concerns around food were experienced as connected and intertwined - topics that constitute distinct policy areas for the regulator were seen by the public as interconnected: for instance, animal welfare and food safety, or healthy nutrition and affordability. This made ranking their interests a challenging task for people.

Given the pressures outlined above, on a day-to-day basis, people tended to prioritise their immediate needs and interests: ensuring the food they ate was safe and as healthy as it could be for the budget they had to spend. For most, wider ethical, environmental and food systems interests took a backseat in their day-to-day food choices - as a result of financial or time pressures, lack of availability or accessibility. However, these systemic considerations were deemed by people as important to resolve in the long-term, and the frequent compromises made around these issues was a source of deep worry.

In this report we explore the public’s ‘wider interests’ in broad order of priority. This rough order of priorities was true both for the Northern Ireland and the wider UK samples:

1. Ensuring equitable, affordable access to safe, healthy food
2. Ensuring high quality UK food safety, hygiene and standards
3. Ethics, environment and systems issues
4. Ease of making healthy, nutritious choices.

However, in practice, the public's priorities were not as clear cut as this simple 'ranking' would suggest. For example, many took passionate interest in long-term and future-facing issues, they just didn't feel they had the ability to act on these in their own personal choices, especially on a day-to-day basis.
Tangible, specific issues also sometimes attracted more public interest than complex concerns. For example, issues like ‘plastics waste’ or ‘supporting British farmers’ were ranked as stand-out priorities for action - even though these were not necessarily the highest priority concerns overall.

The public wanted decision-makers to support both their immediate interests and concerns - to make it easier for them to make everyday food choices that align with their needs and values - and to protect the long-term interests of people and planet.

**Priority area 1: Equitable, affordable access to safe, healthy food**

- Issues related to rising prices, the affordability of healthy food and social inequalities dominated - in terms of the public’s current worries; concerns for the future, and priority actions. This was seen as an issue space that affects all other public food interests.
- Concerns in this space were slightly higher in Northern Ireland than for the wider UK:
  - 80% in Northern Ireland (vs. 76% UK average) chose ‘the price of food’ as a concern for the future of food over the next three years.²⁹
  - 73% (vs. 68% UK average) saw the cost of healthy food as a major concern for the future.
  - 67% of people (vs. 64% UK average) cited ‘food poverty and food inequality’ as a major concern for the future of food in the UK over the next three years.
  - Ensuring ‘healthy food at affordable prices’ was the top priority for action for the food industry, and the second-highest priority action for the Government'.²¹
• For the wider UK sample, concerns around food prices were highest amongst those already food insecure; people with long-term health conditions; women; Asian, Black, African and Caribbean people; and people with food allergies or intolerances.
• Notably, this was a top priority area even for those who are highly food secure, likely reflecting both concern for others as well as an increasing sense of diminishing affordability even for the more ‘well off.’

Priority area 2: Ensuring high-quality food safety, hygiene and standards

Food safety, hygiene and standards were seen as priority public interests that needed to be represented and protected: no one wants food that will make them unwell or is produced to questionable standards. In the minds of the public, ‘high standards’ were also associated with better health impact, and more ethical, sustainable practice. Key findings in this space were as follows:

In general, public trust in current UK food safety, hygiene and standards was high
• 79% trusted their food is made and stored according to good safety standards.22
• 78% trusted the places they eat or buy from handle food safely and hygienically.
• Qualitatively, people perceived UK food hygiene and safety standards as ‘higher’ than those in other countries - especially around hidden ingredients, hormones and food cleaning (such as chlorinated chicken).
• Participants in qualitative groups expressed a sense that ‘someone’ is looking after food safety, hygiene and standards for the greater good.
• However, knowledge of the specific remit and role of the regulators varied between individuals and was generally low. The most visible aspect of the regulators’ role was the safety inspection ratings on food outlets’ doors (Food...
Hygiene Rating Scheme). Many were interested in knowing more about the regulators’ activities.

However, lower income and less food secure people expressed more concern

- Across the UK sample, concerns around safety, hygiene and standards were higher across a number of measures for people on lower incomes (less than £19,000 annual household income) and/or those who were less food secure.
- This seemed linked to wider concerns and worries about ‘risky’ practices employed to help make money stretch: for example eating or freezing about-to-expire food; batch cooking; buying ‘lower quality’ foods, etc.
- Concerns might also have been influenced by a general sense of precarity more widely; many had nowhere else to compromise in their food budgets.

Many worry about whether standards will be maintained post-Brexit

- 57% in Northern Ireland (significantly higher than the UK average of 50%) expressed major concerns about food standards post-Brexit. In particular, many worry that post-Brexit, ‘poor practice’ from abroad will increasingly decrease the safety and quality of food available in the UK.
- Participants in the qualitative research widely wanted high standards upheld in the future. Amongst survey respondents, 45% (vs. 44% UK average) explicitly stated that high standards of food safety and hygiene across the food chain are important to them for the future.

Many want action on wider ‘safety issues’: processed food and animal welfare

- In line with previous FSA and wider evidence, a large proportion of the public in Northern Ireland, as in the wider UK, worried about the long-term safety of things ‘added to’ the food they eat, and/or highly processed foods.
- Many were concerned that although these foods are ‘safe right now’ they may cause long-term or more subtle negative impacts on health and well-being.
66% in Northern Ireland (vs. 61% UK average) expressed concerns about the ‘over-processing’ of food in the UK’s food future.

45% (vs. 47% UK average) stated they would like to see regulatory action in order to ‘reduce things added in the food process e.g. E-numbers, preservatives’.

61% (vs. 60% UK average) rated treatment of animals in the food chain as a major concern.

Qualitatively, there was a sense that fair treatment of animals in the food chain goes hand-in-hand with good food safety and quality standards.

**Priority area 3: Guiding fair, ethical and sustainable food systems and futures**

The public didn’t feel much agency in terms of their ‘wider interests’ around food system ethics and environment; their values in these spaces tended to be sacrificed for more immediate drivers, especially in response to financial pressure.

Accessing trustworthy information in this space also felt hard. Many did not trust the information provided by food businesses, and on-pack information about environmental impact and animal welfare weren’t easy to understand or didn’t include the kinds of information people wanted. For example, participants noted that it was hard to get a sense of things like ‘food miles’, land use, hormone use, and so on.

The public wanted the Government, food industry and the FSA/FSS to work together to guide fair, ethical, sustainable food systems and futures on their behalf.

**Most immediately, people wanted to see protection for British farming post-Brexit - and were eager for support for more 'local' food systems (of UK origin)**
● 59% (same as the UK average) said they worry about the future of British farming
● 62% (vs. 58% UK average) expressed concerns over UK ‘dependency on food imports.’
● 66% (significantly higher than 59% UK average) said they trust local food producers to have higher quality standards than big business.
● 64% (again significantly higher than 47% UK average) said they actively try to buy from local food producers.
● People wanted to see decision-makers maintain or strengthen ethical standards in the food chain, for example around animal rights - both for UK-made and imported food products.

**More broadly, climate and animal welfare concerns dominated**

● Qualitative research showed that interests and concerns in this space feel increasingly more immediate and more relevant to more people.
● 62% in Northern Ireland (vs. 60% UK average) said they worry about the environmental impact of our food systems.
● 60% (vs. 58% UK average) cited the impact of climate change on food production as a major concern for the next 3 years.
● 40% (vs. 41% UK average) choose 'a food system that treats animals in the food chain with dignity' as a key action area for the next 3 years.

**Food waste and packaging waste were flashpoints for concerns:**

● 67% in Northern Ireland (vs. 65% UK average) said they worry about packaging waste in the food chain
● 67% (same as the UK average) reported that they try to reduce or avoid food products that create plastic waste.
● 77% (vs. 78% UK average) said they find it unacceptable to throw food away at home
● 68% (vs. 64% UK average) reported worry about food waste in the food chain.
Ethical treatment of food system workers was potentially an emergent concern.

- 53% (significantly higher than 46% UK average) said they see treatment of workers in the food chain as a major concern
- 32% (same as the UK average) said that they see fair treatment of these workers as a priority over the next 3 years.
- 51% (vs. 48% UK average) chose ‘ensure fair treatment for workers, farmers and small producers in the food chain’ as a priority issue for action from the food regulator.

Priority area 4: Making it easier to access and choose healthy, nutritious food

As above, price dominated within health and nutrition concerns, with many feeling ‘priced out’ of the food they thought was best for their health. Beyond price, the public felt it was far harder than it should be to make healthy, nutritious choices. However, guidance on healthy nutrition tended not to feature highly in ratings of priority actions. Key findings in this space:

Most want to eat healthily and feel they broadly know what ‘healthy’ food is

- People wanted to live healthy lives even if this requires effort - 69% (vs. 63% UK average) said they are prepared to make big changes to their lifestyle in order to be healthier.
- Most (66% in Northern Ireland vs. 70% UK average) also said they feel that they know what a healthy, nutritious diet is - typically, associated with ‘fresh’, minimally processed food and wide variety.

However, making healthy, nutritious food choices feels challenging in practice

- Price and other pressures often push out health and nutrition ideals
○ In Northern Ireland, 60% (which is significantly higher than the UK average of 53%) said they feel priced out of healthy food.

○ 38% said they find it difficult to find fresh foods that fit their budget (also significantly higher than the 31% UK average).

○ 55% (vs. 54% UK average) said that they think supermarkets encourage the purchase of unhealthy foods.

○ 32% (significantly higher than the 25% UK average) agreed that heavily processed foods are often the only option available to them.

○ 58% (significantly higher than the 50% UK average) reported worry about the long-term impact of their food choices on their health (significantly higher for those aged 18-44 (67% vs. 60% UK average).

● A majority also felt confused or misled by industry information about 'healthy food'.

○ A range of issues were raised around interpreting and navigating health information (overwhelm, text size, portions confusion, ‘hidden’ sugars’, etc).

○ 63% (vs. 61% UK average) felt that foods labelled as ‘healthier options’ (for example, low fat, low sugar, plant-based meat alternatives) are unhealthy in other ways.

● Guidance to support healthy choices often felt unhelpful or ‘too simplistic’

○ Advice often felt more theoretical than practical, not reflecting modern pressures, conflicts, tensions, health needs, personalised diets, and so on.

○ More financially pressured people particularly were interested in ‘real life’ guidance for eating on a budget: support to navigate abstract ‘rules’ into actual shopping decisions.
Chapter 1: Introduction

Background and objective

In this chapter we outline the context in which this work was commissioned and delivered; our key objectives; and the methods and samples used in our mixed-method qualitative and quantitative investigation. Please see the Technical Appendix for full methodology and sample detail.

1.1 Background to this research

The Food Standards Agency (FSA) and Food Standards Scotland (FSS) are independent government departments tasked with ensuring ‘food we can trust’ for people in the UK, and ensuring that food has a strong reputation for safety and authenticity both in the UK and abroad. Beyond food safety, their work also supports wider public interests around food - issues such as food price, availability, standards, and (some elements of) standards around environmental and animal welfare concerns.

The FSA and FSS have amassed a rich evidence base on what matters to the UK public in relation to food and food governance, including how their views, behaviours and needs have changed over time. This evidence base has consistently shown that the UK public have strong views and needs around wider food issues that stretch far beyond food safety. It also shows a clear public expectation that decision-makers should work collaboratively and proactively to ensure that these needs and interests are protected.

The last several years have presented widespread and rapid change that has profoundly shaped both the evolving UK food system and the public’s experiences within it:
● Pandemic disruption has often accelerated existing trends in changing consumer food behaviours and attitudes. Over the last two years, many people have reassessed how they eat, where they shop and what their priorities are around food.26

● Brexit has caused profound shifts in UK supply chains and standards,27 raising public awareness and discussion of these kinds of systems-level food issues.

● Food availability has been disrupted, especially in devolved nations and more rural locations.28 56% of UK people experienced some level of shortage in Q4 of 2021.29

● The UK public are increasingly interested in the environmental implications of our food systems - people report feeling concerned about the impact of food production on the environment (sustainability) and the welfare of animals in the food industry (both 62%).30 A similar pattern is observed in our findings.

● Half of UK families have experienced reductions in disposable income since 201931, at the same time that food prices have risen, including sharp rises during periods of lock-downs32 and higher rises for basic / budget food items.33 Rates of food insecurity and food-bank dependence have increased substantially.34 35 36

In light of this rapid and widespread change, the FSA and FSS commissioned this research to provide up-to-date understanding of:

1. **how the public’s wider interests around food are changing**, and the key experiences and influences that shape their views and needs;

2. **how experiences, views and needs vary**: what matters most to whom, and who is most affected by any current challenges in the system;

3. **expectations and priorities** in terms of how the FSA/FSS and others ensure these wider needs and interests are heard, represented and protected.
1.2 Developing the research aims and objectives

Our research was designed to explore the following six topic areas, all of which were consistently highlighted in previous research as shapers of UK food experiences:

1. **Food safety and hygiene** - exploring any changing views or emerging challenges around the FSA/FSS core remit: ensuring that food is safe to eat right now and in the future, and being able to trust that the places people eat are handling food safely.

2. **Health and nutrition** - what people feel makes it easier and harder to eat in ways that nourish them and support their health, and what they would like to see done in this space on their behalf.

3. **‘Juggling’ price, value, quality and convenience** - how easy people find it to make food choices that work for them whilst balancing sometimes competing drivers in terms of budget, food quality, nutrition and convenience needs.

4. **Trust and transparency** - whether people feel they can get clear, trustworthy information about their food and the food system - for example, in terms of information on food labels, but also more widely.

5. **Animal welfare, environment and future generations** - the impact of the food people eat and food systems on animals, the environment, and future generations.

6. **Regulation and communications** - whether people feel the Government is protecting their interests and needs around food, whether they feel they have the information they need to make decisions, and what they need to see, hear and believe to feel that their interests have been protected.

The specific objectives explored within each key issue area evolved over the course of the research. For example, during the qualitative research it became clear that concepts like ‘trust and transparency’ or ‘regulation and communications’ were
The specific objectives explored within each key issue area evolved over the course of the research. Our approach and materials were also shaped by:

- **Rapid mapping of existing literature and insight**
- **Input and guidance from a 'People's Voice Advisory Board'**
- **Support from our academic partner: food systems expert Dr Christian Reynolds (Centre for Food Policy at City, University of London).**

### 1.3 Qualitative primary research

A total of 95 participants were included via a mix of group workshops, remote ethnography tasks, and 1-1 depth interviews. This included 75 ‘general public’ participants, and 20 people from ‘targeted groups - people typically less heard by policymakers.

Sample and approach summaries are provided below. Please see the Technical report for full methodological, sample and analysis details; copies of materials used; and information on participant safeguarding.

#### 1.3.1 Sample and approach: ‘general public’

Our ‘general public’ sample included a roughly representative spectrum of UK participants in terms of demographics (age, gender, lifestage, income, ethnicity, nationality and so on).

**Total sample:**

- n=75; 40 England, 10 Wales, 10 NI, 15 Scotland

**Approach:**
• **13 x 1.5 hour group workshops with a pre-task (n=75)** - the pre-task included two short 15-minute tasks to identify the core issue spaces to explore with participants in the group workshops.

• **Two week online ethnography (n=40)** - A selection of general public participants completed 5 online tasks each over the course of 2 weeks, exploring around 4 interest areas each.

• **13 x 1.5hr group workshops with a pre-task (n=70)** - all participants came together for a final workshop focussed on public priorities for policymakers.

1.3.1 Sample and approach: ‘targeted groups’

**Total sample: n=20; 11 England, 3 Wales, 3 NI, 3 Scotland**

• 11 people with household health issues or disabilities shaping food choices;

• 9 ethnic/religious minority participants;

• 5 older adults (age 70 plus);

• 6 very low income participants, and 9 who had experienced some level of food insecurity in the last year.

• 4 people who were less digitally confident.

**Approach:**

• **20 x 1-1.5hr targeted depth interviews** - 1-1 sessions allowed focussed exploration of participant contexts and how these shaped interests and needs.

• **6 x follow up tasks** - to explore issues in more depth.

1.4 Quantitative primary research

The approach and the contents of this phase of work were directly informed by the qualitative primary research described in section 1.3 above.
A summary of sample and approach, including details of the food security measure used, are outlined below. Please see the Technical Report for full methodological, sample, and analysis details plus full survey content.

1.4.1 Sample

Online research with 6175 participants was conducted between 14 and 28 January 2022 with adults aged 18+ across the four nations of the UK. Within each nation, nationally representative quotas were set on age, gender, classification of Chief Wage Earner, as well as monitoring ethnicity and incidence of long-term chronic conditions. Data was then weighted to form a UK total representative of all nations in the right proportions.

1.4.2 Contents and approach

The online survey, lasting 20 minutes, was positioned as being on behalf of the FSA (in England, Wales and Northern Ireland) and FSS (in Scotland). The questionnaire collected information about people’s socio-demographic situation, food shopping and food preparation behaviour, food security, and attitudes to a range of topics impacting food choices. The survey also explored respondent’s concerns, areas of interest and priorities for government, industry and the food regulators in the next three years.

1.4.3 Food security measure

Given the prevalence of people’s concerns around food prices and their impact on food choices identified in the qualitative stage, and with the input of the research’s People Voice Advisory Board and academic validation from the Centre for Food Policy at City, University of London, a bespoke approach to food security was implemented in the quantitative stage. This approach built on the USDA food insecurity measure but was designed to provide a comprehensive view of the range of food behaviours that people experience in relation to financial pressures.
Chapter 2: The UK public’s wider context

Pressures, uncertainties and challenges shaping the public’s food experiences, interests and concerns

In this chapter, we outline some of the key pressures and tensions around money, profit and public needs that shaped public decision-making around food in Northern Ireland.

As in the rest of the UK, in Northern Ireland we saw that the public felt they were navigating an increasingly complex, challenging food system that often prioritises profit over people or planet. Their ability to consistently access and choose safe, healthy affordable food was under increasing pressure, as was their ability to shop in line with their wider values. Most also did not trust or feel supported by either government or industry, and information that should in theory support informed decision making often felt inaccessible or misleading.

In particular, financial pressure was causing increasing strain for many in Northern Ireland, as in the wider UK. Most reported that the price of food and, for many, limited food budgets, often 'squeezed out' other high-priority and immediate considerations such as health and quality - let alone more systemic considerations around environment, fairness, welfare, etc. Many were also experiencing reduced food security, in ways that tracked alongside existing social inequalities, and even higher-income people increasingly found their food choices shaped by financial concerns.

Overall, compared to the UK findings, there was a slightly heightened sense of pressure on people from Northern Ireland as compared to the UK average - for example, in terms of:
• Significantly higher numbers of people reporting feeling under stress trying to ‘juggle’ the tastes and needs of everyone in the household;

• Somewhat lower rates of people feeling they can afford the food they want to eat;

• Significantly higher percentages of people changing food habits to save money;

• Fewer people at ‘no risk’ of food insecurity;

• Somewhat lower percentages of less food secure people reporting being able to eat balanced meals;

• Somewhat higher percentages of less food secure people saying they had been unable to afford food; and

• Slightly lower trust in Government and local authorities to support their needs.

2.1 For the UK public, food choices often felt like ‘an impossible juggle’

2.1.1 Core public interests driving food choices often conflicted in challenging ways

As evidenced in previous FSA/FSS research, the UK public often felt that the core drivers of their food choices often exist in tension, which made it very difficult to ‘get it all right’ in terms of their daily food choices. Core drivers (price - quality - health - convenience - values - taste - and so on) often pulled them in different directions.

For example:

• higher quality food was perceived as more expensive;

• food in the more convenient formats (such as semi-prepared, pre-prepared, ready to eat) was perceived as less healthy and/or safe;

• needs of one person in the household often conflicted with the needs of another;
• ‘healthy’ food felt more time-intensive to make, sometimes unrealistically so;
• figuring out an ‘environmentally friendly’ way to eat took more time and energy; etc.

The net result of ‘juggling’ these layered interests was that food choices felt pressured and complex for many. Most people wanted to meet as many needs as they could, but acknowledged that trying to reconcile multiple needs at once took time and energy. For example, people talked of the difficulty of weighing up the emotional, physical, financial and logistical impact of one option versus another; of investing more time and effort to ‘stretch’ food budgets by ‘shopping around’ across multiple suppliers; and of the emotional toll of feeling they were ‘getting it wrong’ despite their best efforts.

Those with caring responsibilities often felt the weight of this ‘juggle’ particularly heavily, including parents (especially mothers, who were more likely to hold the domestic labour of meal planning and cooking) and those caring for adult dependents.

Of note, Northern Ireland saw the highest level of agreement with ‘I find it difficult to juggle the tastes and needs of everyone in my household’: 39% agree with it, significantly higher than other nations (vs. 30% UK average).

2.1.2 The ‘juggle’ gets harder when there’s more to balance or less ‘give’ in the system

People experienced this ‘juggle’ around food choices in very different ways depending on individual context. Some had more to balance, less time or emotional energy to ‘spend’ making choices, or smaller food budgets that restricted the options available. For example:

• parents were often balancing conflicting needs across the household (as above);
● people with very pressured or unpredictable work schedules had less ability to plan ahead, invest in food preparation; or ‘shop around’ to help meet their needs;
● people with serious health issues often had a more urgent need for healthy food - but potentially more constraints on time or budgets’ (see Ch. X for more detail);
● some more remote rural residents had to spend more time to access food, or restricted access to choice because they were limited to a small number of local shops - meaning they had less ‘flex’ in terms of food options; and
● some neurodiverse participants talked about the extra emotional and physical ‘costs’ of visiting retailers and making food choices, limiting their decision ‘bandwidth’.

“Supermarkets are a very stressful situation. To enable me to choose optimal healthy food, I need to see/feel/smell foods. This is difficult for me due to being on the [autistic] spectrum and time spent in the supermarket is limited. Also unhealthy convenience foods are easily accessible.” F, 40, C2, White, Child 16+, LGBTQ+, Rural Northern Ireland

“It’s more expensive for me to do what I need to do because of my disability. So I feel penalised in that sense.” F, 48, DE, White, Lives Alone, Avoids Some Foods for Health Reasons, Disability and Mobility Issues, Rural Northern Ireland

2.2 Profit and price pressures drove compromises and insecurity

In the ‘juggle’ around food choices outlined above, food budgets and food price were often highly constraining factors. Those with more to spend had more ‘flex' to
use to make choices that met most or all of their needs; those with less to spend typically found their choices harder, and made more compromises around food.

Most people in this research were experiencing financial constriction of their food choices in some way, with a sizable minority experiencing low food security (reduced quality, variety of desirability of diet for financial reasons) or very low food security (disrupted eating patterns or reduced food intake for financial reasons). Food security levels tracked with wider established social inequalities in the UK.

“Things are going up by a pound. If you buy 10 items that have gone up by a pound thats 10 pounds and that really adds up at the end of the month.” M, 62, C2, Older Children, Suburban Northern Ireland

### 2.2.1 Few felt able to regularly make food choices that fully meet their needs and values

Fewer than half of respondents in Northern Ireland (48%) felt that they can afford the quality of food they want at all times - this is directionally lower than in the other nations of the UK (vs. 52% UK average). Although respondents wished that price and quality were fairly equal drivers in terms of their food choices, followed by health and nutrition, in actuality, food price trumped all other drivers.

“My money isn’t going as far anymore in terms of everything increasing. And food, I mean, you can turn down your heat, you know, you can do certain things to mitigate against other increasing price rises. But food there’s only so much you can do because it’s a basic necessity, for survival.” F, 42, B, White British, Child 16+, Northern Ireland

**Figure 1. Influences on food choices, ideal world vs. reality [CHART 13]**

This chart shows the average share of influence out of 100 for a range of factors - in terms of how people would choose foods in an ideal world, and the way they
choose in reality.

Influences on food choices: ideal world vs. reality – Northern Ireland
Price and quality would ideally share equal importance in consumer food choices, but in reality price is key

This sense of restricted choice and agency is a source of widespread public frustration, especially among those on lower incomes.

2.2.2 Price pressures drive uncomfortable compromises for many

Many expressed deep frustration about the compromises they had to make in terms of food quality, health, nutrition or wider values as a result of limited budgets and/or financial pressure. Across age, gender, and income bands, it was clear that the food that people most valued in terms of health, and that felt most ‘positive’ in terms of wider impact on people and planet, generally felt unrealistically expensive.

“All I want is to be able to feed myself and my family fresh healthy nourishing food that is sustainably produced without a huge negative impact on the planet. I can actually do this tomorrow but I will need to be on a six figure salary, but I’m not. So Waitrose and the Marks and Spencer food hall and the beautiful ruby and white butchers are a fantasy while I ponder the offerings of my local Iceland and Lidl.” M, 47, D, British Asian, Children 8+, Bristol
This feeling of having to make consumer choices that felt out of line with their wider interests and values created a sense of “cognitive dissonance” - a discomfort created by the gap between what people said they wanted and valued versus what they actually bought and ate in practice. Health and nutrition interests in particular were often compromised when budgets tightened. For example, many lower income participants said that they were often unable to afford even simple ‘fresh’ foods - which they want to prioritise in terms of health, safety and enjoyment, but these are more expensive than the more processed or convenience options.

Sometimes, this feeling of being unable to afford fresh ingredients for cooking also resulted in reduced engagement and connection to cultural heritage or community, for example for minority ethnic group participants who felt ‘priced out’ of cooking cultural favourites.

2.2.3 Financial pressures increasingly shape food behaviour even of ‘more secure’ people

Fewer than half in the population (48%) felt that they can afford the quality of food they want at all times - this was directionally lower than in the other nations of the UK (vs. 52% UK average). Indeed, price pressures were having a significant impact on people in Northern Ireland. In the last 12 months:

- 36% said they had 'swapped branded products for cheaper alternatives to fit budget (UK average 30%)
- 21% said they had reduced the quantity of fresh produce or fresh foods they buy, to save money (UK average 17%).

Only 26% of participants in Northern Ireland had not had to make any changes to their behaviours whatsoever in the last 12 months as a result of money worries: 74% had adjusted their behaviour, significantly higher than in all other nations (65-67%).
“Deliveries used to be fine until most of the supermarkets increased their minimum spending to £40 pounds. But £40 a week when there's only one person to feed, it's a lot of money.” F, 48, DE, White, Lives Alone, Avoids Some Foods for Health Reasons, Disability and Mobility Issues, Rural Northern Ireland

2.3 Low food security drives compromises on basic sufficiency for many

It was not the aim of this research to provide robust estimates of food security levels for the UK population; readers particularly interested in this space may find tracking data provided by the FSA elsewhere useful. However, our data do clearly show that many in Northern Ireland, as in the UK more widely, reported behaviours in line with low or very low food security. The table below represents food security rates indicated by our data, adapting USDA categorisations to indicate the degree of food security risk.

Table 1. Prevalence of very low/low food security in Northern Ireland

As explored in detail in previous FSA and wider research\(^49\), for these individuals the consequences of low food insecurity were often serious and multiple. Among those classified as very low or low food secure\(^50\)\(^51\):

- 59% in Northern Ireland (vs. 52% UK average) said they had been unable to eat healthy balanced meals in the past 12 months (vs. 4% for those food secure\(^52\) (same as the UK average).
- 45% (vs. 43% UK average) had skipped meals because there was not enough money for food (vs. 2% for those food secure (1% UK average).
- 34% (vs. 40% UK average) said they had been unable to buy food due to lack of money (vs. 1% food secure (same as the UK average).

“Fresh” (minimally processed) meat and produce were often amongst the first ‘luxuries’ to go when budgets tightened, leaving many to worry about the impact of their food choices on health. People also worried that the food they could afford was low-quality and below minimum acceptable standard; tasting bad, nutritionally suspect, and low-enjoyment.

“We buy fruit to eat healthy, we take vitamins also to try be healthy or help our immune systems. We hear at times, ‘this food causes cancer,’ then ‘this food has been recalled’ but to be honest as long as we have a meal each day we are happy. And as long as they are not eating too much of fatty foods for their bodies that can cause health problems.” F, 46, D, Children Under 18, Mobility Issues, Suburban Northern Ireland

Moreover, financial pressures increasingly shaped food behaviour even of ‘more secure’ people: only 26% of respondents (which is significantly lower than the 35% in the UK as a whole) reported that their choices had not been affected at all by financial worries - with a significant majority (74% vs 65% in UK as a whole) modifying their food behaviours as a result of financial concerns.\(^53\)
2.4 Trust was low that public interests in this space were being protected

As in the wider UK, the public in Northern Ireland expressed low trust in food businesses. As is explored in detail in the overall UK report, across almost every topic area there was an assumption that business was highly influential in the food system - and that it prioritised its own interests over people (both consumers and food system workers), animals and planet.

- Across all socio-demographic groups, 79% of survey respondents in Northern Ireland (vs. 75% UK average) reported feeling that ‘the food Industry is putting profits before people’s needs.’
- Only 41% (vs. 39% UK average) believed ‘big food companies treat their workers fairly’.
- Only 22% (vs. 19% UK average) trusted food manufacturers and brands as sources of information about food.

Worryingly, there was a widespread sense of public cynicism about whether ‘Government’ acts as an effective counterbalance to corporate interests in the food system. Trust in Government was low, with only 32% (same as the UK average) of people reporting they trusted the Government to act in their best interests generally. When it came to information about food specifically:

- 15% of Northern Ireland’s citizens said they trust their Government for information about food (compared to 18% in Wales and 24% in Scotland.)
- Only 9% (vs. 14% UK average) said they trust the UK Government, ministers and departments.
- Only 10% (vs. 11% UK average) said they trust their local authorities (consistent across all nations).
2.5 Implications for policy-makers and decision-makers

The wider contextual challenges outlined in this chapter are largely beyond the scope of any one body to address. Food poverty and social inequality can’t be solved by a single Department or simple policy change; they are systemic issues requiring collaborative, systemic, sustained action.

However, this report details people’s experiences and needs around these wider tensions and concerns because the public wanted their worries to be heard. Policy-makers must account for these across all areas of action they take on the public’s behalf. Acknowledging these challenges and incorporating them in planning and action is critical to representing and protecting the public interest around food.

It is also important to register that the widespread frustration and perceived lack of agency experienced by the public seemed to be contributing to a sense of unease about the UK food system as a whole. There was a sense from many that as our food systems evolved, they had become more global, more profit-driven, more influenced by big food businesses, and more focused on processed food - and that along the way we made natural, fresh, healthy food less accessible.

“When did it happen that buying good, local food became something that only wealthy people could afford - when did that become artisanal rather than just the way that we eat? Why is it that in our system it’s only the ultra processed stuff in boxes that you can afford, and the only stuff that’s ever on sale?” - People’s Voice Board member
Chapter 3: Equitable access to safe, healthy, affordable food

In this chapter, we briefly explore a public desire for change that stretches across a range of ‘wider interests’: the desire for everyone to be able to access safe, healthy, affordable food. There was a strong belief that everyone ‘should’ have access to this, but concerns about rising food prices made many fear that the future of UK food would likely be more unequal.

We explore public views in this area, which were seen as influencing all other ‘wider interests’ and concerns (for example food safety, hygiene and standards; health and nutrition; and ethics and environment issues). Each of these specific ‘wider interest’ areas are then explored in depth in the Chapters to follow.

In general, views of people from Northern Ireland were in line with the wider UK averages, albeit with:

- very slightly higher percentages of people indicated concern about the future of food prices, and about food inequality
- slightly higher ratings for all ‘action areas’ for the regulator that would support more equitable access to safe, healthy, affordable food - for example in terms of ensuring promotions of fresh (not only processed foods), ensuring greater choice of low-priced foods of good quality, and so on.

3.1 Northern Ireland consumers want everyone to have access to positive food choices

In line with recent evidence from the FSA and others, the majority of people in this research felt that everyone in Northern Ireland (and the UK) should have access to healthy, nutritious food. Most believed that regardless of personal circumstances, people should be able to eat food that keeps them in good health and able to
function - and were frustrated that a ‘well off’ nation like the UK was far from realising this ideal. When people were asked to outline positive food futures they thought that the UK should aim for, more equitable access to healthy, affordable food featured strongly.

“Given that we are currently battling with a very obstinate Covid pandemic, and the fact that I reside in the North of Ireland, where we are suffering from serious food/produce supply issues, I would first of all like to see a return to something approaching the norm. That said, in a perfect world subject to climate changes and free trade agreements with other nations, I would like to see produce of good quality finding its way to our larders at a sensible cost.”
M, 62, C2, Older Children, Suburban Northern Ireland

Recent media coverage around inequalities in food access seemed influential in shaping these views, with the ‘Free School Meals’ campaign led by Marcus Rashford and partners (such as the Food Foundation) being particularly powerful. The idea of children going hungry during a public health crisis (Covid 19) proved highly evocative, as had social media coverage of ‘sub-par’ free school meals supplied by contracted providers.

The strength of public opinion in this space had likely also been affected by personal experience. Given the number of people experiencing lowering food security themselves or feeling under pressure around food prices, the fragility of food security was increasingly becoming a tangible reality in the UK public's daily lives rather than a point of abstract ethics.
3.2 However, this aspiration seemed increasingly out of reach - and rising food prices proved a major ‘flashpoint’ of public concern

Despite these optimistic aspirations, fears about the future were prevalent. The public expressed widespread concern that their agency, choice and security around food will face increasing pressure in the future.

22% (vs. 20% UK average) of survey respondents in Northern Ireland spontaneously raised the increasing price of food as something that worries them for the future - this far outweighed any other concern in terms of top of mind salience for respondents. 67% (vs. 64% UK average) chose food poverty and inequality as a priority area of focus over the next 3 years, with many also expressing this concern spontaneously.

For some lower income participants, price concerns were so dominant as to make discussion of other issues almost impossible. Several qualitative sessions with lower-income participants needed to be paused or stopped for safeguarding reasons in response to visible participant distress.

Although people on higher incomes experienced less pressure, they too have experienced rising costs and other issues that restrict choice (like food shortages). This seemed to be contributing to a sense of unease about whether their needs would be protected in the future - with this realisation serving as a source of deep concern for many. Many who felt ‘safe’ themselves also expressed worries about widening social inequalities and the impact on UK society as a whole.

“The price of food at the minute is becoming scary. My wages are not increasing as quickly as the price. I feel the same variety is not available to me
post Brexit and availability of these things in the future hangs in the balance.”
F, 42, B, White British, Child 16+, Northern Ireland

3.3 Representing and protecting people’s interests around equitable access to safe, healthy, affordable food

3.3.1 Future focus
The public in Northern Ireland - and in the UK at large - wanted their ability to access safe, healthy, affordable food to be protected. They see this as a priority area for government and regulator intervention, as they do not believe that food businesses will prioritise public interests in the absence of external pressure.

A majority of people (55% in Northern Ireland vs. 50% UK average) saw access to healthy food products at affordable prices as important to them for the future (39% cite this as a priority area vs. 34% UK average). Furthermore, 43% (vs. 41% UK average) mentioned access to good quality, low priced-food that is not over-processed 24%, same as UK average, cite this as a priority area).

Note that as reported above, interest in this issue registered elsewhere in the survey was even higher: 80% of the total sample (significantly higher than 76% UK average) indicated that the price of food is a concern for the future; 67% (vs. 64% UK average) say the same for food poverty and inequality. However, qualitative evidence suggested that there was real cynicism about whether Government and regulators could or would actually take action in this space, which may have influenced how survey respondents chose which actions they would like to be prioritised.

3.3.2 Action areas for the regulator (working with partners)68
Overall, the public wanted the regulator to work with partners in order to deliver genuine choices for people in terms of quality, healthy and affordable options. The number one priority people want to see actioned is to ensure that low-priced foods
meet a good baseline level of quality, and conversely, that good quality food (including local and fresh produce) is also affordable. The public would also like to see action around ensuring that promotions include fresh produce and fresh foods, not just processed foods.

Whilst activities in this space may not fall directly within the regulator’s remit, the pressures on the public described in this chapter, not least price pressures and increasing food insecurity, are informing the public’s desire to see access to affordable healthy nutrition to be safeguarded in some form.

The first column below shows the action areas in priority order of mentions:

Chapter 4: Food Safety, Hygiene and Standards

4.1 Overview

Overall, as in the rest of the UK, the public in Northern Ireland clearly cared about the safety, hygiene and standards of the food they eat and wanted to see their interests in this space protected. Most believed that the food they eat is safe and hygienically handled, and many express a high degree of pride in UK food standards. Experiences were less positive and trust was lower amongst lower income and less food secure participants.

However, many worried about the maintenance of our standards in the future (post-Brexit) and about the long-term safety of things ‘added to food’ like hormones, pesticides and additives. Allergen management and information is also an area of concern for many.

Participants were eager to see a ‘strong’ regulator who represents and protects their interests in this space - for example, by clearly prioritising people over profit. They are eager to see the safety, hygiene and standards of the food we eat in the UK maintained and-or strengthened in future, particularly in terms of protecting standards post-Brexit.

In general, views in Northern Ireland were in line with the wider UK averages, with some slightly or significantly higher indications of pressure or concern. For example:

- Significantly more people in Northern Ireland feel they have to rely on convenience or highly processed foods (typically, due to financial pressures);
- There was significantly higher concern about whether food standards will be maintained post-Brexit; and
There was slightly higher support for actions that would make it easier to report unsafe practice, and slightly more interest in communications about food inspections.

4.2 Public interest in hygiene, safety and standards issues

4.2.1 Hygiene, safety and standards remain core interests for the UK public

Food safety, hygiene and standards were all issues that clearly mattered to participants, viewed as foundational food issues that affect everyone in the UK; no-one wishes to have unsafe, unhygienic or low-standard food. In the qualitative research, this was ranked as the top issue area in terms of public priorities - and was also consistently chosen by participants as a priority issue for discussion in the group workshops.

In line with previous evidence people in this research tended to conflate questions of 'safety,' 'hygiene' and 'standards' - and their responses to one or more of these issues were often deeply emotive.

On a personal level, participants spoke about the importance of avoiding food poisoning and ill health; their responsibilities to keep children or loved ones safe; managing allergen exposure risk, and so on. As discussed elsewhere, for some participants this topic also encompassed concerns around ‘things added to food’ such as pesticides or hormones (see Ch 4.2.3), or the long-term sustainability and environmental impact of our food systems, especially around animal welfare standards (see Ch 4.2.4).

For participants with health issues, disabilities, and/or allergies food safety often felt particularly urgent. For example, some participants noted that food poisoning or
allergen exposure might have serious and/or long-term consequences - reducing their ability to work, or worsening sometimes already precarious health.

“My main concern is the lack of information on the effect on people like myself who have allergies to most vegetables almost being forced to eat fake meat products”. Quantitative survey participant, Male, Upper SEG, Mature family, Northern Ireland.

4.2.2 Covid and Brexit may have heightened public consideration of this space

The Covid-19 pandemic seemed to have heightened public awareness of safety and hygiene issues. There was a sense that the pandemic had made many participants more conscious about hygiene issues in relation to food preparation, packaging and delivery. Notably, in contrast to FSA research conducted in early 2020,60 there was no sense that people thought the pandemic or associated financial pressures had resulted in ‘slipping standards’ for food businesses.

Brexit media discussion and lived experience of the impact of Brexit on food transport and availability also seemed to have driven more consideration of issues such as international food standards or global supply chains, with many participants in the qualitative research spontaneously raising examples of ‘lower’ standards elsewhere. For example, participants referenced concerns around ‘chlorinated chicken’ or ‘hormone injected beef’. These were much lower profile issues in FSA research discussions in earlier years, often requiring substantial education and prompting to enable discussion.

“When you compare EU standards to American standards, the EU on the face of it would appear to be significantly higher. I would worry that after Brexit our government would ditch the EU regulations in favour of a less robust process that generates more revenue for the economy.” F, 42, B, White British, Child 16+, Northern Ireland
4.2.3 However, safety, hygiene and standards are not core decision making drivers

For most survey respondents, safety and hygiene considerations did not play a big role in everyday food purchasing decisions. We measured this quantitatively by asking survey participants to consider 8 major drivers of choice61 - identified in the qualitative stage - and allocate 100 points, however they wanted, to show the relative share of influence of each factor on their day to day food choices.

In terms of day to day decisions, health and safety considerations attracted on average 11 points out of 100, meaning that its weight on the decision, or share of influence, was 12% (vs. 11% UK average). This is significantly below factors of price (25% vs 24% UK average) and quality (17%, same as UK average), and on par with factors of health and nutrition (12% v 13% average) and convenience (12%, same as the UK average).

As explored below, this is likely because of respondents' assumptions that the food they eat is generally safe, hygienically handled, and governed by strong standards. They appreciate being able to trust that their interests are represented in this space and value food safety, but do not think much about it day-to-day. In effect, food safety, hygiene and standards are quite literally 'hygiene factors' in people's day-to-day food choices.

“I think food is getting safer. I think this is because there is an increased awareness on how important food safety is and most councils will now monitor restaurants and takeaways to ensure they comply with regulations. There are also high standards set by the government to ensure that food manufacturers are following strict health and safety checks. As a whole, society is more conscious about health and increasingly so, so I think this will continue.” F, 37, C1, Children Under 12, Rural Northern Ireland
4.3 The general public view on current food safety, hygiene and standards

In general, public experiences around UK food safety, hygiene and standards are positive, and trust in the safety of the food they eat is high. However, there are some common areas of concern, centring around enforcement, the long-term safety of more heavily processed foods, and allergens regulation and information provision.62

4.3.1 Most have high confidence in UK food safety, hygiene and standards

In general, the public in Northern Ireland, and in the wider UK, believed that the food they eat is governed by high standards, handled and stored hygienically, and safe to eat. 77% in Northern Ireland (vs. 78% UK average)63 trusted that the places where they eat or buy from are handling food safely and hygienically. 79% (same as the UK average) trusted that the foods sold in shops are made and stored according to good safety standards.64

In line with previous evidence,65 qualitative discussions suggested that this high participant confidence was rooted in generally positive personal food experiences, supported by signals that ‘someone’ (the FSA/FSS and its partners) was looking after public interests in this space. For example, most felt that:

- Hygiene ratings show that safety/hygiene standards are regulated and enforced
- Supermarket shopping and most restaurant experiences were safe and hygienic
- Sell-by dates show ‘someone’ wants to help keep them safe
4.3.2 Enforcement was a concern for some: ‘are regulators actually upholding the rules?’

Despite the public’s general trust and confidence in this space, they did express some concerns - often about whether the ‘signals’ they saw that ‘someone’ was looking after their interests were actually supported in practice. For example, participants raised questions around:

- Why food businesses with low safety and hygiene ratings were allowed to stay open
- Whether ‘bad businesses’ were ‘really’ being made to improve practice
- Why supermarkets are allowed to send short-dated food to online shoppers
- The safety and hygiene practices of smaller or independent businesses.

When asked about these concerns, participants’ discussions often centred around low levels of trust that the Government had enough power - and/or enough will - to enforce rules and penalise poor practice. These discussions often aligned with wider concerns about who ‘government really cared about protecting’: the public or businesses.

“In every industry worldwide there will always be someone who can make something cheaper. This is not necessarily a bad thing in itself but invariably there is always something that has to be sacrificed... The food industry is a monster of diverse procedures and standards that can often be interpreted in many different ways... and if left to their own devices... somebody is gonna find a way to cut corners, to make more profit and somewhere risk is going to be introduced.” M, 62, C2, Older Children, Suburban Northern Ireland
4.3.3 Many worried about the safety of highly processed foods and want transparency

In line with previous FSA and wider evidence, a large proportion of the public in Northern Ireland (and the wider UK) expressed worry about the long-term safety of things ‘added to food’ like hormones, pesticides and additives. 45% of respondents in Northern Ireland (vs. 47% UK average) stated they would like to see regulatory action in order to ‘reduce things added in the food process e.g. E-numbers, preservatives’.

Concerns centred around the long-term health and safety implications of these additives. In contrast, fresh, organic, ‘unprocessed’ or minimally processed food was too expensive and/or time consuming to be a realistic choice for many. 48% of respondents in Northern Ireland (significantly higher than the 40% UK average) say they ‘often rely on quick to prepare convenience foods (for example ready meals, frozen pizza, fish fingers, nuggets etc.)’ and 32% (significantly higher than the 25% UK average) agree that heavily processed foods are often the only option available to them.

Participants also expressed frustration about a perceived lack of transparency about exactly ‘what is in our food’. Information on labels (for instance about additives or preservatives) felt hard to understand; looking up information about things like pesticide or hormone use was challenging; many felt uncertain that they could find ‘the truth’ regardless. In responding to this statement, “I find it difficult to understand what a product contains”, only 37% disagreed. This suggests that for 63%, there is a degree of difficulty in understanding what is in the food that people buy. For many, this sense that the food system has ‘opaque’ and ‘black box’ elements contributed to concerns about whether public interests were being adequately protected.

Participants also voiced frustration about the fact that, since this information is not easily traceable, no one can be held accountable. As elsewhere, concerns felt
amplified for those that had lower general trust in business, and in government/regulators to prioritise public over business interests.

4.3.4 People saw animal welfare as a key part of food safety and hygiene
Animal welfare was also a concern area in food, with 61% of survey respondents (vs. 60% UK average) seeing the treatment of animals in the food chain as a major concern. It seemed that for most people, this was raised primarily in relation to questions of food trust, safety and transparency than in terms of ethics or animal rights per se. As per the discussion around processed food, above, there was a sense that things ‘done to’ animals used for food production might have a range of negative impacts - including on long-term human health.

Ethical (not ‘safety’) concerns around animal welfare are discussed in more depth in Ch 5.1.

4.3.5 More support was wanted around allergen information, regulation and enforcement
Ensuring protection for people with allergies and hypersensitivities also emerged as a substantive area of concern, particularly, but not only, for those directly affected.

42% of respondents in Northern Ireland (vs. 39% UK average) agreeing that they were ‘concerned that the way allergens are labelled on food packs is unclear’ - notably much higher than the 8% of respondents (vs. 9% UK average) who themselves lived with allergies or hypersensitivities. ‘Enforcing clearer labelling of food ingredients and allergens’ was cited by 46% of respondents (vs. 43% UK average) as a priority action area for regulators.
Likewise, many participants in the qualitative research reported they found it difficult to access the information they needed to make safe, informed decisions about allergenic ingredients and/or cross-contamination risks. Whether eating out, food shopping or preparing food at home, participants often found allergen information hard to access, inconsistent and/or unclear.

For example, participants raised examples of restaurant staff making people with allergies feel unwelcome or not being able to distinguish critical allergen information from wider ‘lifestyle choice’ ingredient notices. Precautionary allergen labelling such as ‘may contain’ notices were reported as particularly confusing.

These clarity and access issues, coupled with a perception that food businesses seemed not to take allergen concerns seriously, had the effect of making people feel less safe, unsupported, and less trusting of food businesses and regulation alike. In discussions, there was a palpable sense of frustration from some participants.

4.4 The public worry about whether standards will be maintained in future

The effect of Brexit was of particular concern in Northern Ireland, with the public’s worries centred around whether the standards food is held to in the UK will change as supply chains and trade agreements evolve post-Brexit. 57% of survey respondents (significantly higher than 50% UK average) reported concern about food standards post-Brexit. As previously mentioned, media coverage of post-Brexit trade deals and standards seemed to have been influential in shaping views in this space. For some, concerns around increasing food travel times also played a role.

UK wide, concerns over less stringent food safety standards post-Brexit were significantly higher amongst women, people under 45, and ethnic minorities. The
reason for this is uncertain, although some conjectures can be made from the wider evidence about potential drivers. Across the research, these groups tended to express more concerns and worry overall, potentially driven by the sense of more ‘pressure’ around food (as explored in Ch 2.2). These demographic variables are also associated with risk factors in terms of lower food security - aligning with the increased sense of risk exposure in terms of food safety, as above.

“What makes me feel less safe is watching how the USA processes food and worrying about trade deals after Brexit, how these hormones pumped chickens and dairy products may end up here!!!” F, 37, C1, Children Under 12, Rural Northern Ireland

4.5 Summary: representing and protecting people’s interests around food hygiene, safety and standards.

4.5.1 Future focus

As seen in the UK as a whole, the public in Northern Ireland are keen to ensure that food safety, hygiene and wider standards ‘don’t slip’ or are strengthened as the global landscape changes. In Northern Ireland, 45% (vs. 44% UK average) of people want to see high standards of food safety and hygiene across the food chain in the future - and 28% (vs. 24% UK average) cite this as a priority area for them as consumers.

As above, key concern areas centred around ensuring standards are maintained or strengthened post-Brexit, ensuring strong UK food business safety and hygiene via strong regulator enforcement, and more widely around ensuring transparent guidance and information about the long-term safety of processed foods and current animal welfare standards in the food chain.
### 4.5.2 Action areas for the regulator

Overall, it is clear that respondents want the regulator to take a stronger stance against corporate failure to uphold standards, and to enforce stricter standards on additives and labelling - they are looking to the FSA to take action with the food industry as a higher priority to providing guidance to individuals. The first column below shows the action areas in priority order of mentions.

Chapter 5: Ethics, environment and systems

Impact on people, animals, country and planet

In this chapter, we discuss wider food issues that many in the public care about, but often don’t feel they can prioritise on a personal, day-to-day level. In the context of a deep gap between people’s interests and their perceived control over their choices, the public are eager for decision-makers to take action and drive positive, sustainable food futures.

There was widespread public engagement and worry about environmental issues, including around how our food systems can help or harm the planet, and how we can minimise and/or adapt to the increasing threats of climate change. For the public, food ethics and environmental considerations are intertwined with other interests discussed previously: what was assumed to be bad for the planet was often assumed also bad for people at multiple levels.

More widely, there was evidence of public interest in more ‘systemic’ food system issues, linked for many with concerns around the future of British agriculture. There was strong engagement with questions of how to support and protect British farmers and UK agriculture post-Brexit, and widespread interest around questions of what more ‘local’ agricultural systems could look like in the UK. Specific issues around worker rights and agricultural innovation were less common but potentially emergent interests.

In Northern Ireland, there was a higher sense of ‘closeness’ to local food economies evident in both the qualitative and quantitative research. Compared to the UK averages, amongst people from Northern Ireland in this research there was:
• significantly higher regular usage of local producers, and significantly higher trust of local producers, including as sources of information about food
• higher spontaneous and significantly higher prompted concern about Brexit and the future of local UK farming
• higher than average concern about treatment of workers in the food chain; and
• Slightly higher endorsement of all potential actions related to ethics, environment and food worker treatment issues

5.1 Public interest and engagement around food ethics and environment

5.1.1. Food ethics and environmental considerations intertwined with other interests

Participants tended to express needs and interests around ethical and/or environmental issues as connected to other interests and concerns discussed previously. What was assumed to be bad for the planet was often assumed also bad for people at multiple levels. In the long term, this is due to the negative impacts of intensive or mass production food systems on climate change and therefore on the human population, whilst in the short term, due to mass-market food production impacting public health and wellbeing.

For example, participants tended to associate a number of negative issues with more processed food: less ethical and environmentally friendly food production practices; more use of additives, pesticides and hormones; reduced ‘quality’ and ‘safety’; potentially poorer worker treatment; lower animal welfare; and so on.

Interests in this space were often two-fold: the public were eager to see food systems that feel fair and positive for people and the planet in general, and they
also often had concerns about how ‘unfair’, ‘unethical’ or ‘unsustainable’ practices affect them now.

5.1.2 The public were highly interested in the future of British agriculture
Across the UK sample, participants in this research were keen to discuss systemic food system issues which in previous research have been areas that raised interest only among a minority. Qualitatively, spontaneous reference to what have previously been seen as ‘abstract’ food issues was notably higher than in previous FSA research, and spread amongst a broader spectrum of public audiences.

When asked about their concerns for the future of food in the UK, respondents in Northern Ireland spontaneously mention issues such as Brexit (12%, significantly higher than 5% UK average), animal welfare (4% vs. % UK average) and British farming and imports (2% vs. 7% UK average). These issues were often interlinked in people’s minds.

5.1.3 Many aspired to a more eco-friendly diet, but there were widespread barriers to public action and engagement
Regardless of their personal interest levels, most people in this research prioritised more immediate, personal interests and needs in their day-to-day decisions. For example, 58% of survey respondents in Northern Ireland (vs. 54% UK average) reported they would like to have a more eco-friendly diet - but only 30% (vs. 28% UK average) said that they tend to look for food that is ‘organic or 100% natural’ (assumed to be ‘eco-friendly’ amongst qualitative participants). 47% (vs. 46% UK average) reported being prepared to pay more for food that is ‘environmentally-friendly’ or made to high welfare standards.

Barriers described by participants include the need to prioritise other decision-making factors (especially price); a lack of easily accessible, trusted information; and
feeling that the problem is ‘too big’ for individual decisions to make a difference. It was striking that ‘tangible’ environmental issues like food and packaging waste often acted as flashpoints for engagement, likely in part because they felt more contained and feasible to tackle.

5.1.4 The public had a wider interest of the mutual impact between our food system and the environment in the long-term

When they think about the future over the next three years, it is clear that the public in Northern Ireland, as in the rest of the UK, see a relationship where the food system impacts on the environment, and the environment impacts on the food system. While they appreciated that these impacts have the potential to be positive, the majority believed that the current relationship does more harm than good: 62% of survey respondents in Northern Ireland (vs. 60% UK average) reported worry about the impact of our food system on the environment; 60% (vs. 58% UK average) cited the impact of climate change on food production as a major concern for the next 3 years.

5.2 The general public view on food ethics and environment issues

5.2.1 Many felt priced out of making food choices that align with their wider values

There was a widespread sense that ‘ethical’ and environmentally friendly foods come at a price premium - making these wider consumer interests particularly vulnerable to price pressure. For example, this was assumed to include organic produce, ‘ethically reared’ meat, Fair Trade products, locally produced foods, etc.
Buying food that felt ethically sound thus felt like a privilege available to the few, not an option for the many.

This made environmental and ethical concerns particularly vulnerable to price pressure, leaving many feeling that they could not fully ‘shop their values’ in this space. For others, it seemed to simply reduce engagement; why worry about something you couldn’t do anything about? Amongst the most price-concerned participants in the qualitative research there was sometimes visible discomfort when environmental issues were raised; it felt like a luxury concern compared to more pressing issues around affordability and access.

5.2.2 Understanding ‘the right choice’ in terms of ethics and environment is a challenge

Despite generally high interest in environmental issues and food ethics, there was a high degree of confusion about what was a ‘right choice’ for people in this space.

Even finding information they could trust seemed to be a challenge for many. Only 42% in Northern Ireland (vs. 43% UK average) reported finding on-pack information about a product’s environmental impact easy to understand; 38% (vs. 42% UK average) find on-pack information about animal welfare easy to understand.

Participants in the qualitative research also spoke about feeling that the ‘true’ environmental or ethical implications of the foods they ate were hard to determine. The kind of information they wanted was typically not available on-pack, and information provided by businesses was often not trusted - with some highly environmentally engaged participants mentioning concerns about ‘greenwashing’.

Although a lesser priority than other action areas outlined in this report, some members of the public (20%) expressed interest in having guidance to make it easier to make eco-friendly food choices in their day to day lives. It was notable that whilst
58% (vs. 54% UK average) expressed an interest in having a more eco-friendly diet, only 19% (vs. 20% UK average) expressed an interest in receiving guidance to achieve this in the future - this implies the issue for respondents is less one of guidance and education, and more one of access and trust in labelling.

“When I buy coffee, I don’t know the producer in whatever country I’m buying it from or where it’s sourced from. How am I supposed to check that you are treating those people fairly and ethically? The Fair Trade thing might be stamped on it, but I don’t know what your definition of fair trade is.” F, 48, DE, White, Lives Alone, Avoids Some Foods for Health Reasons, Disability and Mobility Issues, Rural Northern Ireland

5.2.3. The public wanted a secure future for British farming and local producers

The future of British farming was a strong area of public engagement across this research. Qualitatively, there was a sense of ‘exposure due to Brexit’, with people worried that we would need to adopt ‘lesser’ standards from other countries in future, or that local producers would come under increasing pressure in future. This was often linked to beliefs that ‘local’ food produced in the UK (or, for many devolved nations residents, within their ‘home’ nation) was likely higher quality than foods imported from abroad.

“If I am buying vegetables I will go to the farm shop and buy them if I can, because it’s fresh. Maybe it’s a bit more expensive but you get better quality.” F, 66, B, Lives Alone, Vegetarian, Rural Northern Ireland

Quantitative evidence confirmed the public interest in this space.

- 59% (same as UK average) chose the future of British farming as a major concern
62% (vs. 58% UK average) reported worry over the UK’s dependency on food imports.

Local provenance was a bigger influence on purchase decisions in Northern Ireland - both in terms of what people do and what they would like to do - than in the other nations of the UK. Whilst price pressures did diminish that influence in real life, it remained stronger than in other nations. Indeed we saw that:

- 64% in Northern Ireland reported that they actively look to buy from local producers (significantly higher than 47% UK average)
- 40% said they food from independent retailers, farm shops or vegetable box schemes at least once a month (significantly higher than all other nations; UK average 30%)
- Although only 3% use these local channels as a main source of food - similar to other UK nations.

A significant majority (66% vs. 59% UK average) trusted local food producers to have higher quality standards than big business. As sources of food information, local food producers (such as butcher’s, local market, farm shop) were also used and trusted more - 27% in Northern Ireland used them for food information (vs. 16% UK average); and 32% reported they would trust the information they provide (vs. 26% UK average).

5.2.4 Some also questioned whether personal action can make a difference

More widely, many questioned whether their choices can have any ‘real’ impact on issues like environmental sustainability or the ‘fairness’ of our food systems - feeling that corporate interests often have much more influence in this space.

Many questioned whether their choices can have any ‘real’ impact on issues like environmental sustainability or the ‘fairness’ of our food systems - feeling that
corporate interests have much more influence in this space. Though 64% (vs. 61% UK average) agreed that ‘as a consumer, my food choices can help shape the food system for the better’, 79% (vs. 75% UK average) endorsed the view that profit drives the food system.70

Qualitatively, some expressed a sense that businesses and decision-makers will only make change if ‘forced to’ by consumers, which for these participants meant personal choices were very important. However, others challenged that under consumer pressure, businesses will often only do ‘just enough’ to be seen as taking action - but not enough to create any real change.

This sense of disempowerment, coupled with worry whether food businesses would ‘do the right thing’ in terms of moving towards more ethical sustainable practice, was a source of clear concern and anxiety for some participants. There was a strong desire from these participants for ‘Government’ or regulators to take action on their behalf - sometimes coupled with cynicism about whether this was achievable in practice.

5.2.5 Food and packaging waste serve as tangible flash-points for wider abstract issues

Waste was one area of the food system where most people felt they had at least some tangible power to take action. Waste was also an emotive issue which strongly engaged a majority of the public, both in terms of food and packaging waste - often discussed in the same breath by participants in the qualitative research.

Amongst survey respondents, views from the Northern Ireland public were in line with wider UK averages:

- 77% (vs. 78% UK average) reported finding it unacceptable to throw food away at home.71
● 68% (vs. 64% UK average) said they worry about food waste in the food chain.
● 67% (vs. 65% UK average) said they worry about packaging waste in the food chain.
● 67% (same as UK average) said they try to reduce or avoid food products that create plastic waste.\(^\text{22}\)

Qualitative research suggested this high public interest is driven by multiple factors:
● Substantial recent media attention on waste issues (particularly around plastics);
● A feeling that waste is a tangible symptom of larger issues (environmentally unfriendly practices; wasteful processes; etc.);
● Belief that some progress has been made (for example around plastics waste) and that further change is possible; and
● Sense of ethical discomfort or moral outrage that some are left hungry whilst elsewhere food goes to waste.

Waste felt like an issue that individuals could have some individual impact on - but there was also eagerness for more systemic change. Many in the qualitative research were critical of the ways in which current food systems encouraged what they saw as 'poor practice' on waste. For example, participants raised discussions around:

● Feeling 'pressured' by deals/promotions which encourage food waste.
● Food being wasted by retailers that could go to those in need.
● Low-waste options being positioned as more premium and expensive.
● Low-waste options being unrealistically inconvenient for many.
5.2.6 Animal welfare and worker rights are also part of a more sustainable future

As discussed elsewhere, animal welfare was a concern for the majority of survey respondents - although for many in qualitative discussions, this seemed to be about assumed ‘safety’ as much as ethics or animal rights. 61% in Northern Ireland (vs. 60% UK average) saw treatment of animals in the food chain as a major concern, though a smaller 40% (vs. 41% UK average) wanted, in the next 3 years, to prioritise action towards a food system that treats animals in the food chain with dignity (as the bigger inference from animal welfare is to do with safety standards and not with ethics).

"Is the FSA there to see what happens to the animal? In my mind the FSA is only going to the restaurant and how clean everything is." TSN2

For some, particularly vegan and vegetarian participants, animal welfare was experienced as an urgent concern. These participants tended to think of animal welfare standards as ‘necessary but not sufficient’ - also wanting to see promotion of food systems which reduced meat consumption more widely.

The treatment of workers in the food chain was spontaneously raised by qualitative participants surprisingly often in comparison to previous research, in which this was generally quite a marginal issue. Quantitatively, 53% (significantly higher than 46% UK average) saw treatment of workers in the food chain as a major concern, and 32% (same as UK average) see fair treatment of these workers as a priority over the next 3 years. Although not a priority as compared to the other issues outlined above, this may thus be an emergent concern with monitoring by the FSA and other decision makers.

In contrast, if farmers and small producers are brought into scope, respondents’ interest in Northern Ireland rises: 51% (vs. 48% UK average) cite ‘ensure fair treatment
for workers, farmers and small producers in the food chain’ as an area for action from the food regulator. This difference is likely influenced by public desire to see a ‘fair deal’ for UK agriculture, as discussed previously.

5.3 Public views on the future of food ethics and environment issues

In the qualitative research, there was a clear sense of urgency for many around the future of food in relation to ethical and environmental issues, including amongst participants in Northern Ireland. Many participants expressed deep worry and anxiety about the increasing impact of climate emergency - and that we might act ‘too late’ in terms of changing our food systems and choices to avoid or mitigate harm.

For example, when completing ‘future of food’ tasks and asked to describe the food futures they feared for the UK, some participants described fairly dystopian outcomes, in which profit motives and lack of public engagement had failed to mitigate climate disaster. Many also expressed concern about disproportionate impact on those already vulnerable, both in the UK and globally.

More widely, there was a sense that people ‘hoped’ for a future in which food systems generally felt ‘more safe and ethical’. Ideally, they wanted to see a food system which served the best interests of animals, people and the planet. Some expressed optimism that a strong consumer voice, smart investment in innovation, and/or dedicated action from decision-makers could help achieve this. However, this was countered by a sense of despair and cynicism from others that meaningful change could be achieved.
5.4 Summary: what people want done on their behalf

5.4.1 Future focus

The public wanted Government, the food industry and regulators to work together towards developing a more sustainable system that is fair, ethical and respectful of animals, people and the planet. This was particularly important in the current context where many people feel they can’t prioritise or take action on more abstract issues themselves.

5.4.2 Priority action areas for regulators

The key sustainability issues that respondents in Northern Ireland would like the food regulator to work with partners on are to: ‘ensure high standards of animal welfare including imports’ (55%), ‘ensure fair treatment of workers, farmers and small producers’ (51%) and ‘set standards to minimise food waste in the food chain’ (49%).

This suggests their focus on reducing food waste is not entirely addressed by the possibility of setting standards around it (qualitative feedback suggests they are looking for more pressure on big brands and retailers to take action).

Chapter 6: Health and Nutrition

As explored previously, there was a strong sense in this research that everyone in the UK should have access to ‘fresh’, healthy, nutritious, good quality food. More widely, there was broad interest in health and nutrition from the public - with perceptions of ‘good food’ typically meaning food that was ‘minimally processed’ and nutritious (rather than just satiating hunger by being filling, regardless of nutritional benefits).

The public want to live in a world in which it is easy to understand what food is healthy and nutritious, and in which it is easy to make healthy choices. In practice, this ideal was felt to be unachievable for many, with barriers at every level: understanding what ‘healthy’ foods to prioritise; navigating food labelling and marketing; and eating healthily within budget and time constraints. There was interest in actions from policy-makers and others that would make it easier for people to choose healthy, nutritious food in practice.

6.1 Public interest and engagement around health and nutrition

As seen in the rest of the UK:

- A majority in Northern Ireland aspired to eat well and valued access to healthy, nutritious food - 69% (vs. 63% UK average) said they were prepared to make big changes to their lifestyle in order to be healthier.

- Covid had increased awareness of health but added pressures on parents, leading to compromises around food due to lack of budget and time.
People placed a high value on ‘fresh’, ‘unprocessed’ and ‘nourishing’ foods - typically described as including fruit and vegetables, ‘traditional staples’ (milk, bread) and ‘good quality’ meat, as well as home cooking.

‘Unhealthy foods’ were often assumed to be more ‘processed’, less nutritionally ‘balanced’, and higher in saturated fat/sugar/salt and ‘additives’. They were perceived as less transparent and more opaque: with ingredients that felt unclear, hard to pronounce, and more ‘chemical’ or ‘man made.’ 48% (vs. 49% UK average) reported making specific efforts to avoid buying foods that contain ingredients such as trans fats/palm oil/preservatives/E numbers. 25

6.2 The general public’s view on health and nutrition in Northern Ireland

Few people in this research felt able to consistently access and eat the food they most aspired to in terms of health and nutrition; there were often large gaps between what they wanted to do in theory and the choices they made in practice. These gaps were driven by challenges and barriers at multiple levels. Individually, these barriers made decision-making around health and nutrition harder. Collectively, they led many to feel that the UK food system was ‘stacked against’ them - with modern consumers driven to make choices that don't align with their health ideals. Eating healthy thus felt to many, like a privilege - not a right.

6.2.1 Navigating ‘what's healthy' felt complex in practice

Many people in this research felt that they had a good sense of what it meant to ‘eat healthy’, and felt it was fairly easy to identify foods which were ‘nutritious’. This instinctive perception was evidenced by 66% of survey respondents in Northern
Ireland (vs. 70% UK average) stating they were ‘confident I know what a healthy nutritious diet is for me’.

However, at a more granular level, the public often felt that deciding what is healthy for them and the people they shopped and cooked for was a challenge. Many found it hard to know which ‘experts’ to trust, or how to navigate conflicting views - for example, with some extolling the virtues of protein for health and strength, and others viewing meat consumption as a public health disaster. Health trends were seen as shifting over time; what was ‘true’ today in terms of the health value of a given food might change tomorrow.

Priorities and needs around health and nutrition were also experienced as dynamic, multiple and often conflicting. Within individuals, needs evolved over time in response to shifting health status, work and family dynamics, moods and mental health states, and so on. Within households, health and nutrition needs are often conflicted; one parent might be shopping for a red-meat restricted partner with heart issues; a gym-going, protein hungry teen; a young picky eater whose vegetables were ‘snuck into’ food, and so on.

6.2.2 For many, healthy eating guidance felt unhelpful and/or outdated

In the face of these layered and complex challenges to healthy eating, the guidance available to the public often felt insufficient, on multiple levels:

- ‘Simple’ guides (like the EatWell plate/guide) were useful in cutting through overwhelm, but felt hard to translate into actual shopping choices.
- Guidance did not feel helpful in navigating layered and conflicting health needs within households.
- Guidance was not seen to take into account financial constraints, or to support people to make realistic healthy choices on constrained budgets.
• Some guidance felt patronising or stigmatising - for example, with some participants citing BMI health guidelines as ‘flawed’ or biassed towards white ethnicities.

• To some, guidance felt overly focused on calories rather than nutrients - this being unhelpful in terms of more holistic health, and harmful in terms of eating disorder management.

Some participants noted that, collectively, these gaps sometimes made them feel as if guidance was being provided by people that were ‘out of touch’ with the modern-day realities facing the UK public.

6.2.3 Food marketing and promotions were perceived as ‘pushing’ unhealthy food

In general, the public in Northern Ireland (and the wider UK) did not feel that food marketing and promotions encourage them to make healthy choices.

• 55% in Northern Ireland (vs. 54% UK average) agreed that they ‘feel supermarkets encourage me to buy unhealthy foods’ – with participants in the qualitative research often reporting frustration that promotions tend to centre on more processed products.

• 63% (vs. 61% UK average) agreed that they ‘often feel that foods labelled as ‘healthier options’ (for example, low fat, low sugar, plant-based meat alternatives) are unhealthy in other ways’.

Many also reported feeling that it was often difficult to tell if a food is ‘actually’ good for you from the claims made by the brand or the look and feel of the product, with 61% of survey respondents agreeing that they ‘often feel that foods labelled as ‘healthier options’ (for example, low fat, low sugar, plant-based meat alternatives) are unhealthy in other ways’.
For example, participants spoke about feeling ‘misled’ by products that were ‘vegan’ or ‘organic’ but included perceived unhealthy levels of fat/salt/sugar and so on. Some also expressed cynicism about the health value of reformulated products - i.e., whether companies were reducing fat/sugar/salt on one side but increasing other ‘unhealthy’ ingredients at the same time.

As a result, many felt as if they were being at best unsupported by the food industry in terms of making healthy choices, and at worst actively misled. Labels and marketing seemed to look as if they were providing useful information for people - whilst actually making their decisions harder. Some participants, primarily younger, voiced these concerns explicitly in terms of social inequalities - worried that poorer UK people are ‘targeted’ by fast food and convenience food brands that may contribute to worse health outcomes for worse-off social groups.

“I wish healthier options were the cheaper option instead of the unhealthy stuff. It’s cheaper for me to buy a frozen pizza and a bag of frozen chips than some fruit. Also where they are displayed in shops, the sweets and chocolate are always placed at tills and just as you go in, so it’s the first and last thing kids see in shops.” F, 29, C2, White, Children <5, Suburban Northern Ireland

6.2.4 Many found health and nutrition labelling hard to interpret or unhelpful

In theory, there is a great deal of health and nutrition information available on food labels to guide choices. ‘Traffic light’ type labels were also considered useful for many; often raised as a gold-standard of clear, simple, visual communication, and generally easily understood.

However, beyond this many found health and nutrition information on labels confusing, hard to read, or unhelpful in terms of actually making informed decisions. 44% of survey respondents in Northern Ireland (significantly higher than 37% UK
average) said they find it ‘difficult to understand what a product really contains’. Qualitative evidence also suggested people faced challenges on many fronts simultaneously, for example in terms of:

- Reading and interpreting scientific and technical terms - particularly given the small text of most label information.
- Accessing clear information about food processing methods used - for example around the use of pesticides, preservatives, hormones, and so on - and their impact.
- Understanding the ‘actual’ amount of fat, sugar or salt in a product. For example, people perceived sugars as being ‘hidden’ in labels by appearing under less familiar names (for instance dextrose, corn syrup) - or that multiple different forms of sugar were being used in the same product.
- Identifying the actual amount of calories included in a ‘realistic’ portion of food; ‘scaling up’ calculations from portion size to packet size/meal size felt difficult.
- Understanding the nutritional density and total ‘health value’ of a given food.
- Using labels to assess information relevant to personal lifestyle or health needs - for example, anti-inflammation diets, ‘heart health’ and so on.

Even where overcoming these barriers felt theoretically possible, it added friction during an already pressured moment of decision making for participants. This had the effect of lowering their ability to make choices in line with their personal health priorities.

“They could say frozen in transport so I know it’s food that I should not be freezing again. I can work out what I’m doing for food for the week.” F. 36, C2, White, Children < 12, Suburban Northern Ireland
“I wish there was more information available to the general public on what steps could be taken in order to live a healthier lifestyle, as well as making the nutritional information on food clearer. I believe this would be beneficial as it would show the real results of eating food which is considered bad for you such as food which is low in fat but has extremely high figures in sugar, salt etc.” M, 33, C1, White British, London

6.2.5 Eating healthily was perceived as a matter of privilege

The public felt that eating in a healthy and nutritious way almost inevitably involved spending more money, more time and effort, or both. The trade-offs between health interests, price and convenience were familiar to many. In Northern Ireland:

- 60% of survey respondents (significantly higher than 53% UK average) reported feeling priced out of healthy food;
- 38% (significantly higher than 31% UK average) said they find it difficult to find fresh foods that fit their budget; and
- 32% (significantly higher than 25% UK average) reported feeling that heavily processed foods are often the only option available to them.

For many people in Northern Ireland, this was clearly a source of direct worry and concern:

- 58% (significantly higher than 50% UK average) expressed about the long-term impact of their food choices on their health. This worry was also significantly higher for those aged 18-44 (67% vs. 60% UK average).
- 49% (significantly higher than 40% UK average) agreed that they worry that their diet lacks variety; this is also significantly higher for those with young families (72% vs. 57% UK average).

This sense of unequal access also sparked a profound sense of unfairness for many, and a feeling that more should be done to ensure all can eat healthily.
6.3 Audience differences in priorities and needs around health and nutrition

6.3.1 Serious illness, allergies and/or disabilities increased barriers for many

For people with chronic conditions, disabilities, or allergies, eating well was often at the forefront of their mind, either because their condition significantly impacted what they could eat, or because they saw eating as a way to heal. Many also needed to take a more bespoke approach to ‘healthy eating’ to avoid unhelpful or harmful ingredients; accommodate nutritional or texture sensitivities; fuel recovery or maximise functioning; and so on.

However, even as healthy eating was often experienced as more urgent or important in this group, for many it was also less financially feasible. For some, health issues significantly restricted income (for example, due to having to reduce or abandon work). For all, costs were higher, for example in the form of:

- Having to buy ergonomic utensils or pre-chopped packaged foods (more expensive than loose fruits and vegetables).
- Needing to rely on more expensive speciality and free-from foods.
- Increased cost of shopping for those with mobility issues (transport, car fuel, minimum spend of £40 for deliveries, food delivery costs).
- Not being able to shop around for more affordable options because of energy deficits, cognitive or sensory overload, brain fog, and so on.

In particular, people experiencing energy-limiting chronic illnesses (ELCI) or disabilities (for example, Long Covid or ME/CFS) faced pronounced barriers to eating well, often needing to sacrifice their nutritional ideals to preserve their energy. This group might be particularly important for food policy-makers to be mindful of given the substantial percentage of people with covid that go on to develop energy-limiting chronic illness.
Preparing food from scratch - in theory, a helpful way to meet bespoke dietary needs and to manage food budgets - took time and energy these participants simply didn’t have. Participants in this group thus faced the dilemma of spending the little energy they have on preparing food that suited their needs or eating convenience foods such as pre-chopped foods or ready meals. However, their options felt unsatisfactory on one or more levels: more expensive, more processed, less fresh, and more likely to contain allergens like dairy or gluten. Some reported skipping meals due to feeling too unwell to shop or cook.

6.3.2 Parents felt under pressure to provide healthy food and unsupported in doing so

Many parents in this research felt our current systems do not support them well enough to provide healthy food for their families. Many expressed frustration about ‘unhealthy’ foods being marketed to children and young people; about the additional difficulty of navigating ‘misleading’ marketing as a busy parent; and the perceived absence of effective food education in schools.

6.4 Summary actions: representing and protecting people’s interests around health and nutrition.

6.4.1 Future focus

As explored in more depth in Ch 2, ensuring the affordability of healthy food was the public’s core concern in this space - in line with concerns about the negative impacts of rising financial pressures and rising food prices more generally. We also saw a level of mistrust from participants that foods labelled as healthy options may be harmful in other ways.³³

“To change all these things, - factories, schools. It all costs money. And anything that costs money normally doesn’t happen. I don’t really know what
they do.. I would like to think it would change things but are they actually going to do it?” F, 66, B, Lives Alone, Vegetarian, Rural Northern Ireland

Although not featuring in the quantitative survey results, participants in the qualitative research were eager for more action to be taken on food marketing aimed at young people, and for support to help their children establish good habits early. There was also a sense that future guidance needed to be more ‘up to date’ and tailored in terms of helping navigate modern life pressures and barriers to healthy eating.

6.4.2 Action areas for the regulator

People wanted action taken to represent and protect their interests in this space. The main priority of people in Northern Ireland for the FSA was to ensure food health claims genuinely deliver a healthier choice.

However, in qualitative research there was a sense of frustration and powerlessness about this issue, with people feeling unsure whether the FSA or their partners would have any power over issues like these, where drivers of supply and demand became complicated.

The first column below shows the action areas in priority order of mentions

Chapter 7: Priority next steps

Medium-term actions for government, industry and the FSA

This chapter focuses on what people in Northern Ireland see as the priorities for the future of food in the UK over the next 3 years. It summarises what people see as important to them as individual decision-makers in the food system, and how this relates to what they would like the wider Government and industry to prioritise.

7.1 Summary of interests the public want protected

Quantitative respondents expressed their wider interests across a range of topics concerning the future of food over the next three years. These topics were presented in a randomised list derived from participant discussions held at the qualitative stage and categorised into themes at the analysis stage. From these, they also selected up to 3 topics they felt were the most important to them. An index was calculated to measure the strength of interest - this showed the proportion of people who expressed an interest in a topic and who then also selected it as one of their ‘most important’ area of interest. While the baseline measure of interest gives a clear measure of the reach of a particular topic, the strength of interest index provides an important indication of prioritisation for the public.

All four of the ‘wider interest’ issue areas identified in the qualitative research and explored in more depth in the quantitative research were shown as important to the UK public. As outlined previously, ranking these in strict priority order is difficult if not impossible. Public priorities varied even within the same person depending on whether taking the perspective of priorities right now or for my future - and more
tangible ‘actions’ often attracted greater support than more abstract ones, even for issues that people had otherwise ranked as very high priority for them.

However, the key areas of interest for the public, as detailed in the earlier chapters of this report, are roughly ranked as follows (see Appendix A for fuller data tables) - drawing on a combination of qualitative rankings and prioritisations; quantitative issue prioritisations and strength of response within these and so on. As seen throughout this report, there was also a lot of commonality in these overall priorities between people across the four nations - and the priorities in Northern Ireland generally reflected those of the UK as a whole.86

1. **Supporting equitable access to safe, healthy affordable food.** The public want to see Government action to ensure that everyone can access healthy food at affordable prices - and access to low-priced food that is not over-processed and meets good quality standards. This issue was most highly-rated across all future actions areas in the quantitative research, and qualitatively seen as cutting across all other ‘wider interests’ and concerns: if you can’t afford to eat in a safe and healthy way, the other actions taken on your behalf fade in importance in comparison.

2. **Ensuring high standards of food safety and hygiene:** although people trust current standards, they want the level of play in the food chain to remain high in future as the UK food trade evolves. Ensuring ‘high standards across the food chain’ was the second-highest interest area in the quantitative research, and consistently the highest-rated interest area in the qualitative research.

3. **Ensuring ethical, sustainable food systems:** People want decision-makers to ensure that our food systems feel fair, ethical and sustainable. A big ‘flashpoint’ for people is the need to reduce food waste in the food chain; but this complex topic also links to supporting British provenance and ensuring
safe and ethical treatment of animals in the food chain. As discussed in earlier chapters, provenance and animal treatment cut across both environmental concerns (lower transport, lower pollution, avoiding intensive animal farming and its perceived negative impact on nature) and safety concerns (more control of quality standards, food inspection, clarity of labelling, more trust that safety standards and food hygiene have been respected).

4. **Supporting easier choice-making around health and nutrition:** As above, the public’s primary interests in this space were around equitable access to healthy, affordable, fresh food. However, there was also substantial interest in supporting the public to more easily make healthy, nutritious choices—particularly amongst lower-income participants and other disadvantaged groups who were more likely to report low-trust and feeling ‘misled’ or confused by food information and marketing. Quantitatively, ensuring clear information is provided about the food people eat; ensuring foods labelled ‘healthy’ actually are; and providing guidance to make healthy food choices more easily were top interest areas for future action.

7.2 **Priority actions for Government and industry**

Using the same list of topics, respondents also indicated the issues they wanted the Government\(^7\) and the food industry to prioritise in the next three years. In both cases respondents were asked to select up to 3 issues.

There is a lot of commonality in people’s priorities for government and industry, with the same patterns observed overall in the UK,\(^8\) as well as across England, Wales and Northern Ireland on the one hand and Scotland on the other.

This suggests an expectation that Government and food businesses should work together as part of a common framework. This fits a landscape where both parties
are seen as not currently protecting public interests: to address public interests in the future, both need to be involved in taking action.

### 7.2.1 Public priorities for Government

Across all areas of interests, people’s priorities in Northern Ireland for Government were, in order of interest:

1. Access to healthy food products at affordable prices
2. Support for British farmers and producers/fewer imports
3. High standards of food safety and hygiene across the food chain
4. A food system that respects the environment or climate
5. (receiving equal interest)
   a. Access to low-priced food that is not over-processed and meets good quality standards
   b. Reducing food waste in the food chain
   c. A food system that treats animals in the food chain with dignity

### 7.2.2 Public priorities for the food industry

Across all areas of interests, people’s priorities in Northern Ireland for the food industry were, in order of interest:

1. Providing access to healthy food products at affordable prices
2. High standards of food safety and hygiene across the food chain
3. (receiving equal interest)
   a. Reducing food waste in the food chain
   b. Access to low-priced food that is not over-processed and meets good quality standards
4. Support for British farmers and producers/fewer imports
   (significantly lower than England and Wales)
Link to main UK Technical Appendix with full data tables for the above.

8. Perry S. [Latest data highlights a growing mental health crisis in the UK](http://The Health Foundation. 2021; Mental Health Foundation. [Teenagers’ mental health under severe pressure as pandemic continues - new research](http://
15. As noted in the FSA’s Transparency report in 2019: “Participants believed that the strength of the UK food system relies on the cooperation of various stakeholders. Food businesses (farmers, producers, manufacturer, and retailers), Government (local, regional and national), regulators, consumers, and others (the third sector, the media etc.) all have a role to play in protecting the consumer, as participants felt no single body has a full view of the whole food system.”
16. For example, in 2019, 73% of respondents (of those who were aware of FSA) reported trusting the FSA to do its job. Food Standards Agency. Public Attitudes Tracker. Food Standards Agency & Government Statistical Service. February 2020.
17. QX2. Which, if any, of the following have you experienced in relation to food in the past 12 months? - 26% selected “None”, 74% selected one or more changes of behaviour.
19. Here and elsewhere when reporting ‘concerns over the future of food’, reported percentages combine ‘Extremely concerned’ and ‘Quite concerned’ responses.

20. Q20b. Which of these issues would you want the food industry (e.g., retailers, food producers and suppliers) to prioritise in the next 3 years? Maximum 3 issues selected. 34% selected as a top-3 issue.

21. Q20b. Which of these issues would you want the Government to prioritise in the next 3 years? Maximum 3 issues selected. 34% select as a top-3 issue.

22. Here and elsewhere when reporting agreement, reported percentages combine ‘Agree strongly’ and ‘Agree slightly’ response.

23. The FSA and FSS missions and remits differ - with the FSS holding much more responsibility around the promotion of public health via healthy eating.

24. FSA Research Evidence Database: This includes deep deliberative investigation of informed public views; innovative behaviour science and consumer psychology research; longitudinal tracking data of consumer behaviours, needs and views; and rapid response data on public needs in times of crisis.

29. Smith M. How many people have been hit by the global supply chain crisis in Europe and the US? YouGov. December 2021.

33. See for example Jack Monroe’s recent Twitter thread exploring their lived impact of low-budget food price rises. Monroe J, @bootstrapcook. Twitter thread on cost of living & cost of inflation, January 2022. The Office of National Statistics (ONS) will be adjusting the way it tracks inflation for low-income families to reflect these kinds of disparities.
34. The Trussell Trust. End of Year Stats, December 2021.
37. For example, during the qualitative research it became clear that concepts like ‘trust and transparency’ or ‘regulation and communications’ were deemed as lenses through which to view other issue areas - rather than areas of focus in their own right.
38. 16 key documents were reviewed and implications for our method, sample and materials were mapped, to ensure we built on existing data instead of repeating it.
39. 8 UK people reviewed the development of our approach and materials and vetted our participant care approach throughout the project lifecycle. The board included a mix of life-stages, ages, genders, ethnicities and household incomes. After a project onboarding session, we engaged with the board through a mixture of reviewing periods, group feedback sessions and 1-1 interviews. This helped us ensure the public had the opportunity to shape not just our findings, but our approach and questions for the research.
40. Our academic partner provided general support throughout the project design process, and reviewed and consulted on key materials and outputs (e.g. survey design, interim findings, food security investigations and final reporting). In particular, support was provided in terms of developing our bespoke food insecurity measure, adapting USDA measures to also capture ‘softer’ measures of financial pressure and insecurity.
41. Fieldwork was conducted between 15th November and 17th December 2021. In total, the qualitative findings in this report were built from consumer data from a total of 218 completed online tasks and 60 hours of group workshop and depth interview data.

43. In response to: ‘I am financially comfortable and can afford to buy things I want without worrying about the cost’: 44% disagree (vs. 39% UK average), 36% agree (vs. 40% UK average), with the remainder saying they ‘neither agree nor disagree’.

45. We have applied USDA definitions in this research when using the terms ‘low’ or ‘very low’ food security. Low food security: “Reports of reduced quality, variety, or desirability of diet. Little or no indication of reduced food intake.” Very low food security: “Reports of multiple indications of disrupted eating patterns and reduced food intake.” See USDA Economic Research Service. *Definitions of Food Security*. United States Department of Agriculture, for more detail about these definitions.

46. Festinger’s ‘cognitive dissonance’ describes the feeling of discomfort we experience when we hold two conflicting thoughts, or when our behaviours and thoughts are out of alignment. This sense of discomfort often drives us to change our views or behaviour to promote alignment. However, in the case of food choices often there is no ‘change’ that can be made given price and other constraints - leading to sustained discomfort.

47. QX2. Which, if any, of the following have you experienced in relation to food in the past 12 months? - 35% selected “None”, 65% selected one or more changes of behaviour. This included being unable to buy food due to lack of money, cutting meal sizes and swapping from branded to cheaper alternative products.

48. See the following research from the Food Standards Agency: Food Standards Agency & Ipsos Mori. *Consumer insights tracker*. Food Standards Agency. November

50. Bespoke food security classification model - see Technical Appendix

51. Based on responses to ‘Qx2. Which, if any, of the following have you experienced in relation to food in the past 12 months?’

52. In the analysis detailed here, the term ‘food secure’ is used to describe collectively those people classified as having marginal food security, being at risk of insecurity or fully secure.

53. QX2. Which, if any, of the following have you experienced in relation to food in the past 12 months? - 26% (vs. 35% UK average) selected “None”, 74% (vs. 65% UK average) selected one or more changes of behaviour. This included being unable to buy food due to lack of money, cutting meal sizes and swapping from branded to cheaper alternative products.

54. Based on responses to ‘Q14b. Which do you trust for information about food (even if you don’t use it for information at present)? (In Scotland: The Scottish Government / In Wales: The Welsh Government / In NI: The Northern Ireland Government)

55. 15% in England, 9% in Wales, 9% in Northern Ireland, 13% in Scotland.

57. As indicated earlier, 65% have modified their food buying behaviour in the last 12 months as a result of worries over money / finance.

58. See detailed data in Appendix A for Total UK, England/Wales/Northern Ireland combined, and Scotland.
61. These 8 factors were: Food safety and hygiene; Health and nutrition; Environment and animal welfare; Price / Value; Quality; Convenience and ease; Local provenance; ‘Ethics and workers welfare. Each factor was accompanied by a short description on-screen, please see Technical Appendix for more detail.
63. 77% (vs. 78% UK average) agree strongly or agree slightly with: “I trust that the places I eat or buy from are handling food safely and hygienically” (N.B. if we include those saying “Neither agree nor disagree”, the proportion is 94% (vs. 95% UK average).
64. 79% (same as UK average) agree strongly or agree slightly with: “I trust that the foods sold in shops are made and stored according to good food safety standards” (N.B. if we include those saying “Neither agree nor disagree”, the proportion is 95% (vs. 94% UK average) - this is similar to the 90% of people in Food And You 3 who were “very” or “fairly” confident that “the food you buy is safe to eat”); Ipsos Mori. Food and You 2 - Wave 3. Food Standards Agency. January 2022.
67. See detailed data in Appendix A for Total UK, England/Wales/Northern Ireland combined, and Scotland.
68. All figures cited in this paragraph are based on the proportion of people who agree strongly or agree slightly with the statements mentioned.
69. Based on % people reporting being ‘extremely concerned’ or ‘quite concerned’ about the impact of climate change on food production.
70. Proportion who agree strongly or agree slightly with ‘I feel that profit has become more important to the food industry than people’s needs’.
71. Proportion who agree strongly or agree slightly with ‘I find it unacceptable to throw food away at home’.
72. Proportion who agree strongly or agree slightly with ‘I try to reduce or avoid food products that create plastic waste’.
73. Based on responses to ‘Q19a. Thinking about the next 3 years, which of these issues, if any, do you see as important to you for the future of food?’
74. See detailed data in Appendix A for Total UK, England/Wales/Northern Ireland combined, and Scotland.
75. Proportion who agree strongly or agree slightly with ‘I avoid buying foods that contain ingredients such as trans fats / palm oil / preservatives / E numbers’.
76. Proportion who agree strongly or agree slightly with ‘I feel supermarkets encourage me to buy unhealthy foods’.
77. Proportion who agree strongly or agree slightly with ‘I often feel that foods labelled as ‘healthier options’ (e.g., low fat, low sugar, plant-based meat alternatives) are unhealthy in other ways’.
78. Proportion who agree strongly or agree slightly with ‘I find it difficult to really understand what a product contains’.
79. All based on proportion who agree strongly or agree slightly with these dimensions.
80. See Chronic Illness Inclusion for more information.
81. Myalgic encephalomyelitis or Chronic Fatigue Syndrome.
82. See for example Kedor C et al. Chronic COVID-19 Syndrome and Chronic Fatigue Syndrome (ME/CFS) following the first pandemic wave in Germany - a first analysis of a prospective observational study. Cold Spring Harbor Laboratory Press. February 2021; Davis H et al. Characterizing long COVID in an international cohort: 7 months of symptoms and their impact. eClinicalMedicine. 2021; 38; Wong T &

83. 61% agree with ‘I often feel that foods labelled as ‘healthier options’ (e.g. low fat, low sugar, plant-based meat alternatives) are unhealthy in other ways’.

84. See detailed data in Appendix A for Total UK, England/Wales/Northern Ireland combined, and Scotland.

85. Index calculation: (% people selecting a topic in top 3 at Q19b)/(% people expressing an interest in this topic at all at Q19a)

86. See detailed UK figures in Appendix A: Table 1; EWNI figures in Table 2; Scotland figures in Table 3.

87. “Government” was intentionally not defined further, as the purpose was to establish what people saw as falling broadly under the remit of the state (whatever the level or agency involved) versus the remit of private industry.

88. See detailed UK figures in Table 1; EWNI figures in Table 2; Scotland figures in Table 3.
